

Т

4.1. Sector Overview

4.1.1 Current Situation

The Lebanese electric power sector is run by the Electricité du Liban (EDL), an autonomous stateowned power utility, whose mission is to generate, transmit, and distribute electricity to all Lebanese territories (EDL, 2012). The power utility is a public establishment with an industrial and commercial vocation, and is operating under the Administrative Tutelage of the MoEW, which is responsible for policy formulation of the water, power, and fuel sectors.

EDL, founded by Decree No. 16878 dated July 10, 1964, controls over 90% of the Lebanese electricity sector (EDL, 2012). Other participants in the sector include hydroelectric power plants owned by the Litani River Authority, concessions for hydroelectric power plants such as Nahr Ibrahim and Al Bared, and distribution concessions in Zahle, Jbeil, Aley, and Bhamdoun. Hydro power plants have a total installed capacity of 274MW, but due to their old age and the drop in water resources, the nominal generation capacity is around 190MW, constituting around 10% of the total generation capacity of the country.

In 2009, EDL produced more than 15,000 GWh through 7 major thermal power plants owned directly or indirectly by the Establishment and located in different areas of Lebanon and it purchased a limited quantity of electric energy from the concessions (MoEW, 2010). The thermal generation units are operating using heavy fuel oilfired steam turbines at Zouk, Jieh and Hreysheh; diesel-fired combined cycle gas turbine (CCGT) commissioned in 1994 at Beddawi and Zahrani; and diesel-fired open cycle gas turbines (OCGT) at Tyre and Baalbeck. In addition to the thermal units, the sector includes hydroelectric power plants with a total installed capacity of 274MW, but due to their old age and the drop in water resources, the nominal generation capacity is around 190MW, constituting around 11% of the total generation capacity of the country.

Until 2010, additional power has been purchased from Egypt (527 GWh) and Syria (589 GWh) depending on the availability of surplus (WB, 2009). Moreover, Lebanon imports liquefied natural gas (LNG), which is much more dense than natural gas (1/614 of the volume) or even compressed natural gas (CNG), and the project to connect Baniyas in Syria with Beddawi power plant using a 42-km pipeline has been completed in 2005 (EDL, 2008). In 2009, the Beddawi power plant was operated partially on Egyptian natural gas, but the supply of the gas has been discontinued and the 2 combined-cycle plants are currently run on diesel oil.

EDL suffers from substantial technical and nontechnical losses in the transmission and distribution networks. Technical losses are in the order of 15%, compared to a world average of 8%, and non-technical losses, which essentially comprise non-billed consumption of electricity through illegal connections on the distribution network, are reported to vary between regions from 9.6% up to 58%, depending on the region, with an average of around 18%. Moreover, bills collection rates vary from 62% to 97%. As a result, and considering the substantial increase in fuel prices in the world and local markets, see Table 4, and the high technical as well as non-technical losses, the power utility has been running in the last decade with annual deficit mounting to around USD 1-1.5 billion. EDL relies considerably on government transfers aimed mainly at covering the deficit rather than investing in further development activities.

Fuel Type	Year								
	2000	2002	2004	2006	2008	2010	2011		
Fuel oil [USD/barrel]	26.8	33	43	61	46	91	105		
Natural gas [USD/million Btu]	9.78	5.34	6.84	6.3	5.97	4.41	3.6		

Table 4 - Variation of fuel prices over the past decade

Source: (US-EIA, 2012)

With the huge increases in international oil prices in recent years reaching current levels of around USD 110/barrel, the lack of tariff adjustment since 1996 when it was set for oil price of USD 21/barrel has become a clear and present cause of the fiscal drain of the sector (WB, 2009). Lebanon's electricity tariff level is too low to cover the production costs. The contribution of the fuel bill to the total cost was around USD 1,450 Million (75%) and USD 1,165 Million (62%) in 2008 and 2009, respectively. The deficit is further inflated by the high operation and maintenance cost of all power plants, and lack of spare parts.

GHG emissions from the power sector constituted 49% in 1994 and up to 54% of total emissions in 2004, and the sector came second behind the waste sector in having the biggest increase in GHG emissions, see Table 5. This is due to the significant growth in demand for electricity, due in part to the changing socio-economic conditions and to the expansion of the national grid. According to the SNC (MoE/UNDP/GEF, 2011), the sharp increase between the 1994 and 2000 emissions is due to the increase in gas/diesel oil consumption that resulted the installation and operation of the Baalbeck, Tyre, Beddawi and Zahrani diesel power plants during this period.

	1994	2000	2004
Total emissions [Gg]	15,901	18,507	20,299
Energy Sector emis- sions [Gg]	7,743	9,892	10,979
Energy as % of total	48.69	53.45	54.09

Table 5 - GHG emissions from Lebanon

Due to these circumstances, power supply is intermittent in Lebanon, and major power shortages of up to 20 hrs/day interrupt the supply. Therefore, self-generation is playing an increasing role in electricity supply and demand, especially for the industrial and residential sectors. It constituted up to around 500MW, 34% of total consumed power in 2009 (WB, 2011). Standby private generators have ratings up to few hundred KW, and are distributed randomly throughout the country, mainly in residential and commercial sectors, where electricity is distributed to citizens in return of a fee that ranges between USD 100-120 per 5A. Their uncontrolled operations add to the problem of local air quality degradation and noise pollution, in addition to emitting excessive GHG emissions due to the lack of proper and periodic maintenance. The operation cost of private generation is adding substantially the electricity bill that has to be paid by the Lebanese citizens.

To encourage the participation of the private sector in the economy, the Government of Lebanon with support from the World Bank initiated the Power Sector Restructuring and Transmission Expansion Project which calls for a sector- wide structuring and reform aimed to introduce competition and private sector participation in utility operations. The legal framework for privatization, liberalization and unbundling of the sector, as stated in law 462, exists but is not applied yet. Law 462 states that private electricity producers are only allowed to produce electricity for their own private use and cannot distribute electricity to others. Changes have been suggested to ensure the proper and legal implementation of renewable energy technologies and cogeneration. However, the Ministry of Energy and Water is still in the process of modifying these aspects of the 462 law.

4.1.2 Existing Policies and Measures

Since the turn of this century, a number of policies and regulatory decisions in relation to the power sector have been adopted. Table 6 presents a summary of the main laws and policies.

I

Table 6 - Existing policies and measures

Rules/Policies/Regulations	Description
Oil and Gas Law, approved by GoL in January 2012.	The law is developed to administer the country's oil and natural gas exploration, and to allow for the drilling process to start in undusputed off shore territories.
Policy Paper, prepared by the MoEW in June 2010, and adopted by GoL in 2011.	The Policy Paper constitutes a global framework for the power sector in Lebanon, and constitutes 10 strategic initiatives. According to the Policy, the power sector will have more than 4,000 MW generation capacity in 2014 and 5,000 MW after 2015, in addition to a reliable transmission and distribution networks. The Policy calls for resources diversification such that natural gas will constitute 2/3 of the fuel mix with multiple sources of supply; more than 12% of energy used for power generation will be renewable energies by 2020.
Distribution Service Provider project, as suggested in the Policy Paper, initiated by EDL in 2011.	The Distribution Service Provider project has been developed to consolidate a number of currently outsourced EDL tasks in a new contractual framework that ensures proper investment planning, effective execution of network extension, network operation and maintenance, metering and billing activities. The Lebanese power network has been divided into 3 regional distribution service areas based on the energy supplied in the network and energy consumed, billed and collected.
Institutionalization of the LCEC as the National Energy Agency for Lebanon, January 2011.	The Lebanese Centre for Energy Conservation (LCEC), initially funded by the UNDP, is a national governmental organization affiliated to the MoEW. LCEC addresses end-use energy conservation and renewable energy at the national level. It supports the Government in developing and implementing national strategies that promote the development of efficient and rational uses of energy and the use of renewable energy at the consumer level.
The National Energy Efficiency Action Plan 2011-2015, prepared by the LCEC, adopted by the MoEW in July 2010, and approved by the Council of Ministers in November 2011 (Decision No.26).	The National Energy Efficiency Action Plan for years 2011-2015, called upon in the 6th strategic initiative of the Policy Paper, is the first comprehensive strategy in energy efficiency and renewable energy to be ever adopted by a Lebanese Government. The NEEAP includes 14 initiatives including energy efficiency and renewable energy. It takes into consideration the Government's declaration on energy issues, and the strategic target of having a 12% of power generated in 2020 from renewable resources, and to achieve 5% consumption reduction through energy efficiency measures on the demand side.
Energy Law, approved by the Parliament in August 2010.	The Energy law paves the way for off shore fuel and natural gas exploration in the Lebanese territories of the Mediterranean.
Memorandum of Understanding between Central Bank and UNDP. Circular 236, 2010.	Establishment of the National Energy Efficiency and Renewable Energy Account (NEEREA), as a funding mechanism for organizations and private sector to develop EE and RE projects.
Energy Supply Strategy, Council of Ministers, adopted via Decision 13/2004.	The objective is to set an energy strategy based on fuel diversification, and on harnessing renewable resources at national level.

Rules/Policies/Regulations	Description
Law of Electricity Sector Organization, Law 462, adopted by GoL in September 5, 2002.	Electricity Law 462 calls for the unbundling of Lebanon's power sector and the creation of regulatory authority for the sector. This law sets up the rules and principles governing the power sector, including the role of the GoL, and the basis of transferring the sector or its management, totally or partially to the private sector. Several amendments to the law 462 are being currently discussed by the Government and the Parliament to make the law more applicable to present Lebanese conditions, to allow for future plan expansions, and for the penetration of renewable energy technologies. The amended law is expected to make provisions for the feed- in tariff for co-generation, and should call for the introduction of a transition period during which the corporatization of EDL will take place. It shall also call for the gradual introduction of the private sector into EDL through service providers law and new independent power producer (IPP) to build and operate new CCGT units.

In reaction to the current alarming situation of the power sector, the Government of Lebanon has set a number of priorities for the development of the energy sector in general, and for the modernization and expansion of the power sector in particular. The government committed itself in Copenhagen in 2009 to a voluntary target of reaching 12% renewable energy in the current energy mix and presented this commitment in a Policy Paper in 2010.

The MoEW Policy Paper

The policy paper (MoEW, 2010) prepared in June 2010, and approved by the GOL in 2011 constitutes a global framework for the electric power sector in Lebanon, and includes ten strategic initiatives that are integrated and correlated to cover the sector's infrastructure, supply/demand, and the legal aspects. The new policy includes plans to remedy most of the existing generation problems and highlights the necessary infrastructure needed for a secure and economical transmission and distribution networks. According to the Policy, the power sector will have more than 4,000 MW generation capacity in 2014 and 5,000 MW after 2015, in addition to a reliable transmission and distribution networks, and efficient delivery of electricity to cope with the overall socio-economic development of Lebanon. GOL has approved the policy and the implementation process has begun, though with one year delay. The Policy provided the following plans for both the supply, as well as the demand sides.

On the supply side, the additional capacity shall include conventional energy sources, with energyefficient technologies, that are the most economical with the least environmental impact mainly the natural gas; and renewable energies such as wind, solar, and waste to energy. The infrastructure requirements for the natural gas are also included in the policy. The generation expansion will constitute the following phases:

- Renting 250- MW barges as a standby for units to be rehabilitated.
- Building new 600-700 MW generation units, to be operated using CCGT and/or reciprocating engines.
- Securing additional 245 MW through rehabilitation and upgrading of existing plants.
- Building additional 1,500 MW generation units by 2015.
- Increasing the share of hydro power by 40 MW.
- Introducing, in collaboration with the private sector, around 60-100 MW wind power.
- Encouraging the private sector to invest in waste- to- energy units (15-25 MW).

The transmission expansion plan includes:

- Completing the 220- kV transmission line.
- Completing the 400- kV substation infrastructure for the Arab interconnection.
- Establishing the Lebanese Electricity National Control Center.
- Reinforcing existing substations.

The distribution plans include:

- Improving in participation of the private sector, the distribution services.
- Contracting private service providers for distribution.
- Establishing centers for automatic meter reading.
- Introducing new tariff structures and upgraded services for customers.

The Policy calls for fuels and sources diversification such that natural gas will constitute two third of the fuel mix with multiple sources of supply; more than 12% of energy used for power generation will be renewable energies by 2020; and the remaining from other sources of fuel while selecting technologies that work on both natural gas and fuel oil. Initiatives for enhanced energy supply include:

- Developing a plan for an infrastructure to supply and distribute natural gas based on the existing land pipeline in Beddawi and LNG marine station and to interconnect them with the power plants.
- Gradual shift to natural gas as the main fuel for most power plants. Gas could be imported from Turkey, Syria, Egypt, Qatar, Algeria, former Soviet republics, Russia and others.
- Taking all regulatory measures for finding and extracting natural gas from the territorial waters of Lebanon.
- Completing a prefeasibility study and construct a liquefied natural gas (LNG) marine terminal in Salaata or Zahrani.
- Building a coastal gas pipeline to feed all power plants to reduce their operating costs.

On the demand side, the policy calls for several demand side management and energy efficiency initiatives to curb the load growth and improve the load factor. This will lead to guaranteed savings for the economy. These initiatives include compact fluorescent lamps and solar water heater distribution. The new policy also calls for the adoption of standards and labels to promote cleaner technologies. A restructuring of the tariff, leading to a gradual balance in the fiscal budget of EDL, will also be implemented to generate revenues and to unload the financial burden on the economy and the consumer side by eliminating the need for

private generators and providing reliable service without interruptions. EDL will be provided with the necessary financial, administrative and human resources to manage the transition phase until the corporatization is materialized. Collaboration and partnership with the private sector and the donor community to benefit from their vast experiences and resources is also sought.

The MoEW policy paper was followed by the preparation of the National Energy Efficiency Action Plan (NEEAP) aiming at preparing a road map for the development of the energy efficiency and renewable energy sectors and to reach the 12% target of renewable energy by 2020.

4.1.3 Baseline technologies and scenario

Demand for electric power has grown in Lebanon from 7,839 GWh in 2000 to 10,191 GWh in 2004, and to 15,000 GWh in 2009, while the peak electric load in Lebanon increased from 1,666 MW in 2000 to 1,936 MW in 2004, and to 2,100 MW in 2009, with instantaneous peak load in summer reaching 2450 MW (MoEW, 2010, MoE/UNDP/GEF, 2011). Due to the old age of most generation units, the available thermal power capacity is currently around 70 - 80% of the installed capacity. In 2009, the installed capacity was around 2,038MW and available capacity reached 1,685 MW.

Thermal units constitute heavy fuel oil-fired steam turbines at Zouk, Jiyeh and Hreysheh; diesel-fired combined cycle gas turbine (CCGT) commissioned in 1994 at Beddawi, in the north, and Zahrani, in the south; and diesel-fired open cycle gas turbines (OCGT) at Tyre and Baalbeck. In 2009, the Beddawi power plant was operated partially on Egyptian natural gas, but the supply of the gas has been discontinued and the 2 combined- cycle plants are currently run on diesel oil.

The baseline technologies, based on 2010 data, are listed in Table 7 and include the installed capacity of existing thermal power plants, fuel type, annual energy output, fuel consumption rate, emission rates, fuel purchase prices, and annual GHG emissions. Lifecycle emission factors for selected fossil fuels as well as for different types of renewable resources are listed in Table 8. The adjusted emission factor for the power grid is 0.75 tonnes CO₂/MWh.

Power Plant	Installed Capacity [MW]	Fuel Used	Annual Energy Output [MWh/yr]	Fuel Consumption [gr/kWh]	Fuel Price [USD/ tonnes]	CO ₂ Emissions [tonnes/ year]
Zahrani	339	Diesel oil	2,553,888	200	1,100	1,986,925
Beddawi	339	Diesel oil	2,553,888	200	1,100	1,986,925
Zouk	395	Fuel oil	1,981,122	290	700	1,541,313
Jieh	199	Fuel oil	1,098,239	320	700	854,430
Tyre	66	Diesel oil	284,996	330	1,100	221,727
Baalbeck	99	Diesel oil	285,051	330	1,100	221,770
Private generators	500	Diesel	3,478,000			2,705,884
Total	1,937		12,235,184			9,518,974

Table 7 - Baseline data for the existing thermal power plants

Source: (MoEW, 2010)

Table 8 - Lifecycle emission factors in the power sector

Technology	Emission Factor [tonnes of CO ₂ /MWh]
Heavy fuel (HFO)	0.778
Diesel oil (DO)	0.778
Natural gas	0.443
Wind, onshore	0.01
Hydro	0.01
Solar PV cells	0.032
Biomass	0.03

Source: (Savacool, 2008)

Projections for the baseline scenario have been made until the 2020 year, based on the policy paper that states that generation will reach 4000MW by 2014, and 5000MW by 2020. In the absence of secure supply of natural gas, the baseline projection assumes total reliance on heavy fuel oil and diesel oil for the thermal plants. Also, the hydro power available capacity will remain unchanged. Table 9 presents the baseline scenario of power production and related emissions.

Table 9 - Baseline projection till 2020

Year	Thermal available capacity at EDL	Private power generation	Available capacity, including private generation	Annual thermal Energy Output	Hydro energy production	Total annual energy	Annual emissions under BAU*	Annual emissions with 12% reduction by 2020**
	[MW]	[MW]	[MW]	[GWh/year]	[GWh/year]	[GWh/year]	[tonnes of CO ₂ /year]	[tonnes of CO ₂ /year]
1994	1,531	50	1,581	5,184	689	5,873	4,040,042	3,378,140
2000	1,366	300	1,666	10,926	635	11,561	8,506,895	7,216,289
2004	1,437	400	1,837	12,048	540	12,588	9,378,450	8,737,035
2010	1,437	500	1,937	12,703	468	13,171	9,887,967	8,701,411
2014	4,000	0	4,000	26,233	468	26,701	20,414,153	17,964,454
2020	5,000	0	5,000	32,792	468	33,260	25,516,521	22,454,538

* Based on the adjusted grid emission factor of 0.778 tonnes CO₂/MWh for thermal power and 0.01 for hydropower ** Assuming a 12% reduction in emissions by 2020, according to the Energy Policy Paper (MoEW, 2010)

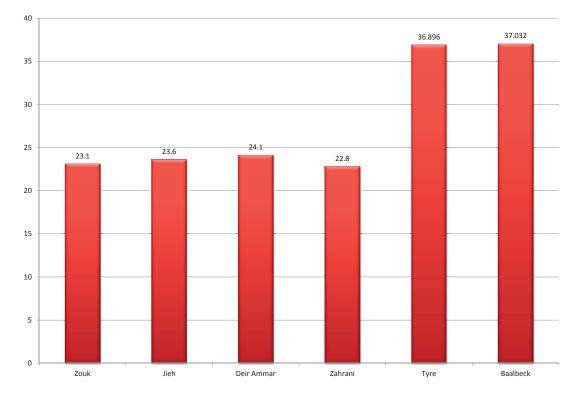

Fig. 3 - Levelized costs of existing power plants

Source: (MoEW, 2010)

The levelized costs of the existing power plants in the baseline are indicated in Fig. 3. The heavy fuel units of Tyre and Baalbeck have the highest cost of around 37cents/kWh, followed by the CCGT units of Beddawi and Zahrani when run on diesel oil, and then by the old units of Zouk and Jieh, run on fuel oil. Levelized costs are based on real figures of power production in Lebanon and take into account fuel prices, additional operation and maintenance costs, and transport costs only for Tyre and Baalbeck plants.

4.2 Possible mitigation technology options in the power sector and their mitigation benefits

4.2.1 Assessment Methodology

The mitigation technologies for the power sector were identified in consultation with experts in the field who contributed to the assessment and also provided local expertise and knowledge on what fit best to the Lebanese conditions. Accordingly, potential mitigation technologies for the power sector have been identified and categorized into small and large scale, and for short, medium, and long terms. Feasibility of these options has been examined through national reports, from the initial TNA report of 2002 (MoE/UNDP/GEF, 2002), and from similar studies conducted in other countries and reports published by international organizations. In addition, estimations based on expert judgment were used when needed data were unavailable.

Based on stakeholders requests and recommendations, the technology selection phase has been concentrated only on hard and soft technologies on the supply side and the analysis was preferred to be restricted to power generation. Concerns were raised on the risk of duplicating existing work, since options related to Demand Side Management (DSM) and energy efficiency have already been extensively explored under other projects and initiatives. Indeed, with the establishment of the Lebanese Center for Energy Conservation in 2002 by a financing by the GEF, the implementation of the Country Energy Efficiency and Renewable Energy Demonstration Project for the Recovery of Lebanon (CEDRO) project since 2007 and the latest National Energy Efficiency Action Plan released in 2011, the demand side management of the power sector is being adequately assessed and analyzed at the national level and appropriate measures have been already deployed on various levels to tackle this issue. The policy paper of the MoEW has indeed identified a number of objectives for the energy sector, however, it did not include the general basis for energy-policy making in terms of import dependence, domestic development potentials in the fields of renewable energies and the challenges the Lebanese society has to face in this context.

Therefore, the scope of the TNA project as set by the stakeholders, was agreed not to tackle energy efficiency and DSM in order to avoid duplication and take the opportunity of the TNA project to assess qualitatively and quantitatively new technologies on the supply side.

4.2.2 Combined Heat and Power

Combined heat and power systems (CHP) capture the excess heat, from power generation to be used, for domestic or industrial heating purposes. CHP is an efficient, clean, and reliable approach for generating power and thermal energy using one energy resource. Such systems involve providing hot water, with temperature in the range of 80-120°C, for district heating by installing new steam turbines from which a portion of the steam can be extracted after being fully expanded in the turbine. Steam can as well be extracted before being fully expanded and therefore by varying the amount of extracted steam it is possible to control the amount of electricity and heat generated. The overall efficiency is around 70%. This scheme, however, requires installing of hot water network that connects the plant to the residential or industrial areas. CHP is an established technology that can greatly increase the facility's operational efficiency and decrease energy costs.

Baseline: In Lebanon, combined heat and power systems are non-existent. Heating services are not provided by the government, instead, heat is being provided on individual basis in the residential, commercial, industrial and service sectors mainly through the use of electricity, diesel oil, LPG and kerosene. However, in this report, it is assumed that the proposed CHP is only replacing the use of electricity for space heating and the use of LPG, diesel oil and kerosene is therefore ignored in this case. Accordingly and estimating that 10% of annual electricity supply is used for space and industrial heating (WB, 2009), the baseline annual emissions for heating purposes sum up to 988,796 tonnes of CO, (based on the adjusted grid emission factor of 0.75 tonnes CO₂/MWh) .

Reduction potential: CHP technologies, with 70% conversion efficiencies, are twice more efficient than existing thermal power plants, and therefore adopting this technology for all thermal power plants would reduce the amount of fuel needed to generate the power required for space heating by around 50%, and consequently would cut the annual CO₂ emissions by half, from 988,796 tonnes down to 494,398 tonnes. Emissions from other fuels such as kerosene, LPG and diesel oil are assumed to remain unchanged.

4.2.3 Combined- Cycle Gas Turbines

In a combined cycle power plant, or combined cycle gas turbine (CCGT) plant, a gas turbine generator generates electricity and the waste heat from the gas turbine is used to make steam to generate additional electricity via a steam turbine. This last step enhances the plant efficiency to levels around 45% to 55%. Deployment of the technology can be achieved either through new installation or by offsetting and modernizing the existing thermal units. This scheme involves installing, in addition to the existing gas turbine, a steam turbine to which steam extracted by the heat recovery unit is fed. The turbine is coupled to a separate electricity generator and therefore using this steam results in generating more electricity. The cost varies between USD 800 and USD 1,200/kW (MoEW, 2010) depending on the fuel type and mode of operation.

CCGT operation requires experienced and people from different expert engineering backgrounds such as Civil, Mechanical, Computer, Communication and Electrical. Lebanon today has two CCGT plants with installed capacity exceeding 400 MW each. Due to the lack of local expertise, EDL relies on specialized utilities and operation companies to manage the plants through operation and maintenance contracts. CCGT is considered in the MoEW Policy paper as an economically feasible option for generation expansion and GHG mitigation. Moreover, the availability of natural gas will also lead to its penetration into the industrial sector. Adopting this technology for the existing Beddawi and Zahrani plants, and at a later stage for the refurbished plants in Zouk and Jieh would reduce the levelized cost from around 23 USC/kWh down to around 9.3 USC/kWh.

Baseline: Currently no CCGT plant is operating on natural gas in Lebanon. In 2009, the Beddawi power plant was operated partially on Egyptian natural gas, but the supply of the gas has been discontinued. The 2 combined- cycle plants (Beddawi and Zahrani) are currently run on diesel oil. Baseline annual emissions from each of these plants are estimated at 1,986,925 tonnes of CO_2 , summing up to 3,973,850 tonnes of CO_2 .

Reduction potential: Switching from diesel oil to natural gas in the Beddawi and Zahrani power plants would inflict an average annual reduction of emissions from 3,973,850 tonnes of CO_2 to 2,262,744 tonnes of CO_2 or 57% emission reduction.

4.2.4 High Efficiency Diesel Generators

Reciprocating internal combustion engines or high efficiency diesel generators are a widespread and well-known high- efficiency technology generally available for power generation applications in sizes ranging from a few kilowatts to over 5 MW (MoEW, 2010). There are two types: spark ignition and compression ignition. Spark ignition (SI) engines for power generation use natural gas, other fuels such as gasoline and propane can be used as well. Compression ignition engines (diesel engines) that operate on diesel fuel or heavy oil, are the more widespread of the 2 types for both small and large power generation applications.

High Efficiency Diesel Generators offer attractive low first cost, fast start-up, proven reliability when properly maintained, excellent load-following characteristics, and significant heat recovery potential. The efficiencies of such engines range from 35-40%. The emissions rate of these engines has improved significantly in the last decade through better design and control of the combustion process and through the use of exhaust catalysts. High Efficiency Diesel Generators start quickly, follow load well, have good part load efficiencies, and generally have high reliabilities. They also have higher electrical efficiencies than gas turbines of comparable size, and thus lower fuel-related operating costs. The cost varies between USD 1,000 and USD 1,600 per each installed kW (MoEW, 2010) depending on the project mode of operation, speed type and the size of units.

Baseline: The difference between the peak demand of 15,000 GWh and EDL's energy supply of 11,522 GWh has been compensated through self-generation and electricity imports from Syria and Egypt during some years. Therefore, small and medium size diesel generators are widely spread in Lebanon in the form of standby generators used in industries, office buildings, services, and residential

sectors, estimated at a total installed capacity of 500MW in 2010. Data on the performance characteristics of existing private standby generators are almost non-existing. It is certain, however, that due to improper maintenance and generators location, the general conversion efficiencies are in the range of 25-30% (EPA, 2008) and their annual emissions are estimated to 2,705,884 tonnes CO₂. Moreover, the random allocation of these units in residential areas is causing excessive local air and noise pollution.

Reduction potential: High efficiency diesel generators with generation capacities up to 50MW and with typical conversion efficiencies reaching 35-40% would be a feasible mitigation option to replace all standby generators and provide up to 500 MW to the grid (EPA, 2008). This would consequently reduce emissions by at least 10% that is by around 270,588 tonnes/year. Moreover, if properly allocated, reciprocating engines would solve problem of air quality degradation and noise pollution.

4.2.5 Wind Power

Windmills are installed to capture mechanical power from the wind to generate electricity on small and medium scale basis. Wind power drives the installed AC (or DC) generators to generate power, which is either stored into batteries, or consumed by the owner, or fed to the network. Small wind generators are used for applications such as battery charging, or auxiliary power for a house; whereas large gridconnected arrays of generators are becoming an increasingly large source of commercial electric power on global scale.

Offshore wind power can make use of higher wind speeds that are available offshore compared to on land. Small onshore wind facilities are used to provide electricity to remote locations. The strength of wind varies, and to assess the frequency of wind speeds at a particular location, a probability distribution function is often fit to the observed data. Different locations will have different wind speed distributions. A wind atlas for the Lebanese territories has been developed in 2010, and could be useful for feasibility analysis of wind power penetration as a clean and renewable resource. The capital cost is estimated around USD 1,900/ kW (MoEW, 2010).

Main features of wind power include fuel diversification, producing no waste and no GHG emissions, power supply for remote areas, and establishment of new jobs. According to the Global Wind Energy Council, there are now thousands of wind turbines operating, worldwide, with a total capacity of around 194 GW in 2010. It has been also reported that the World's wind generation capacity has more than quadrupled between 2000 and 2006, doubling about every three years. In Lebanon, the wind atlas estimated the potential installed onshore wind power capacity to 6.1 GW, adjusted through sensitivity analysis to 1.5 GW (CEDRO, 2011).

Baseline: Lebanon has witnessed a very limited spread of windmill generators used at micro scale levels, limited currently to the residential sector. The wind farm concept is yet to be deployed in the country. Currently, no wind mill farms are operational in Lebanon and electricity is only being provided through conventional thermal technologies and some limited hydropower. In 2012, a tender for the installation of 60 MW of wind energy was launched by MoEW.

Reduction potential: According to the MoEW Policy Paper, wind mills of around 60 to 100 MW are planned to be installed by 2013 in Lebanon via the involvement of the private sector. If achieved, the 100MW wind power would reduce GHG emissions from 144,540 tonnes CO_2 /year from the grid to 1,928 tonnes/year, assuming a capacity factor of 0.22 for wind (MoEW, 2012) and a lifecycle emission factor of 0.01 tonnes/MWh (Savacool, 2008).

4.2.6 Photovoltaic Cells

Photovoltaic (PV) cells are technologies used for direct transfer of solar power to electricity. Photovoltaics were used almost exclusively in space for powering satellites, electrical systems since mid 20th century. It is a process of direct conversion of solar light into electricity at the atomic level. Semiconductor materials, such as silicon, used in PV cells exhibit a property known as the photoelectric effect that causes them to absorb photonnes of light and release electrons. Basically, when light strikes the cell, a certain portion of it is absorbed within the semiconductor material. This means that the energy of the absorbed light is transferred to the semiconductor. The energy knocks electrons loose, and electric current is generated. This power can be stored into batteries, or used after inversion into AC power.

Due to the growing global demand for clean and renewable energy sources, the manufacturing of solar cells and PV has advanced considerably in recent years. Solar PV cells have been growing

rapidly to a total global capacity of 40 GW at the end of 2010, distributed in more than 100 countries. In Lebanon, the CEDRO project has started installing PV cells in around 25 public schools and community centers in different parts of the country.

Main features of PV cells include being renewable and combustion free, support fuel diversification strategy, and like other renewable, could lead to new jobs and expertise. The capital cost is around USD 4,000/kW (MoEW, 2010). The region is rich in solar radiation, and therefore with proper policies and incentives, could witness widespread outside major cities. Feasibility studies associated with the LCEC and NEEAP projects have also been conducted for the deployment of PV cells for street lighting.

Baseline: a limited number of PV standalone systems have been installed in Lebanon as part of private initiatives, or internationally funded projects (CEDRO). This technology is still in its early phases in Lebanon and the NEEAP has identified a number of pilot projects to initiate the deployment of PV systems.

Reduction potential: Penetration of PV cells in Lebanon is expected to be limited to up to 1MW, with a capacity factor of around 0.2 (MoEW, 2012). Considering that the lifecycle emission rate of PV cells is 0.032 (Savacool, 2008), while that of the grid is 0.75, then the 1 MW PV installed would lead to a reduction of to 1,258 tonnes/year or 95% reduction.

4.2.7 Hydropower

Hydropower is the oldest type of renewable energy used by mankind for centuries. Hydro electric power is generated through the use of the gravitational force of falling or flowing water to drive a turbine connected to an AC generator. The generated power is then connected via a transformer to the national grid. It is the most widely used form of renewable energy. It is a combustion- free energy resource which is well established on global scale, and in Lebanon. Worldwide, the installed capacity in 2010 was in the excess of 1,000 GW. Approximately 16% of the world's electricity is renewable, with hydroelectricity account for 21% of renewable sources and 3.4% of total energy sources (REN21, 2011). The capital cost is around USD 5,800/kW, but the operational cost is much smaller than those of fuel- driven power plants. Like other renewable, reliance on power leads to fuel diversification and

GHG reduction. Hydroelectric power plants have long economic lives, with some plants still in service after 50–100 years.

Baseline: In Lebanon, some smaller hydro units along Kadisha river date back to 1917 (Chaaban, 2003). Hydropower has been established in Lebanon for a long time, and therefore, unlike other renewable resources, local expertise is already available. The MoEW policy paper has set a target to generate additional 40MW from hydro resources at an estimated cost of USD 200 million (MoEW, 2010). Moreover, the rehabilitation of the existing hydro plant would provide an additional capacity of around 20 to 30MW.

Reduction potential: Providing additional 70MW of hydropower through new plants and through the rehabilitation of existing ones would reduce emissions by 181,507 tonnes of CO_2 per year assuming a capacity factor of 0.4 (MoEW, 2012) and a lifecycle emission factor of 0.01 tonnes CO_2 /MWh for hydropower compared to 0.75 tonnes CO_2 /MWh from the grid (Savacool, 2008).

4.2.8 Biomass, or Waste- to- Energy

Biomass utilization, specifically urban solid waste and farm waste, could offer an economically feasible option for GHG mitigation (MECTAT 2011, Senayake, 2009). It will also solve the prominent solid waste management issue of Lebanon. There are two proven technologies that give good results, i.e. in terms of waste management and generation of electricity.

Anaerobic digestion of organic waste, which produces biogas, mainly methane gas, is used for power generation. This is a proven technology and it is widely implemented in the EU. Cost of implementing the anaerobic technology is estimated by around USD 1,900/kW.

Dendro Liquid Energy (DLE) technology, a recently developed one, where mixed wastes, including plastics and large size wooden logs, are treated in a reactor to produce carbon monoxide and hydrogen gases, that are clean fuels for generating electric power. DLE, with 80% conversion efficiency, is four times more efficient in power generation, compared with anaerobic digestion. No emissions, no effluents and no nuisance problems take place at the plant sites. At the end of the process 4% inert residues (sand, gravel, etc.) remain that are used for land-filling. It is a close to "zero-waste" technology. This technology is a proven tool in EU that solves the waste management issue of cities and farms and at the same time contributes to the renewable energy basket of countries.

Baseline: No Biomass or waste to energy plant is implemented in Lebanon, although using waste for fuel replacement has been considered by a number of energy- intensive industries as a mean to reduce the fuel bill.

Reduction potential: According to the Policy paper and latest NEEAP, it is estimated that 15-25 MW can be produced every year from waste (MoEW, 2012), hence introducing 25 MW from waste to energy would lead to reducing CO_2 emissions by around 102,492 tonnes per year.

4.2.9 Technology prioritization

Selection Criteria

The assessment of various technologies for the power sector is based on their contribution to sustainable development of the country. The main objectives for technologies selection are maximizing the resilience of the sector to climate change impacts, minimize GHG emissions from the sector, maximize development priority benefits in terms of environmental, social, and economic, and to minimize any negative consequences of the technology (UNDP, 2010).

Accordingly, and after presenting and discussing the selection criteria with stakeholders during individual meetings as well as in the first expert consultation workshop, the defined criteria and the attributed weights have been identified as following:

- 1. GHG reduction potential. Being the main objective of the TNA and TAP project, this criterion has been given the highest weight of 30%. Proposed mitigation technologies would result in GHG reduction, though of different levels, as identified with each proposed technology.
- Fuel cost. Since fuel cost constitutes a substantial part of the operational cost of the technologies, and due to the high fuel prices over the last decade at global scale, rising from \$16/barrel up to current levels of over \$110/ barrel, a weight of 30% is also assigned for this criterion.
- 3. Capital cost. The cost of selected technologies should be affordable, capable of attracting investments, and to be in demand. Several

options will require substantial investment for the purchase of equipment, establishment of infrastructure, and training. This criterion has been assigned a weighting of 15%.

- 4. Additional Operation and Maintenance costs. These periodic costs, over the technology lifetime, are associated with running and sustaining emission-reduction measures after initial implementation. They would cover periodic maintenance and repairs, spare parts, plants management fees and others. Fuel costs are not considered as part of this criterion. The weight allocated for this criterion has been set at 10%.
- 5. Option sustainability. Some options can be financially self-sustaining since the GHG emissions reduction can be associated with a drop in operational costs and more appropriate pricing of natural resources. Winwin opportunities are anticipated from some of the recommended abatement options. This criterion has been also assigned a 10% weight.
- 6. Societal and economic benefits. Several technologies would contribute to the country's environmental, social, and economic development by inducing growth in rural areas, creating new jobs, and strengthening citizens' participation. Since some of these benefits are partially accounted in the energy saving and options sustainability criteria, hence, a 5% weight has been assigned.

Prioritization Process

The technology prioritization process was elaborated following Multi-Criteria Analysis (MCA) approach. Technologies were identified and analyzed based on literature review, field experience and results of individual meetings conducted with different experts working in the field and knowledgeable of specific technologies. Accordingly, factsheets were elaborated and disseminated to a wider spectrum of researchers and technicians from national and international institutions for review and commenting. These factsheets contained detailed information on technology characteristics, institutional and organization requirements, adequacy of use, capital and operational cost, advantages as well as barriers and challenges.

An expert consultation meeting was held to present an overview of the proposed mitigation technologies for the energy sector, and to validate

the proposed weights. The ranking was conducted individually and all scoring sheets were collected and an average scoring was deduced.

Results of the technology prioritization

Based on the above-defined criteria, the ranking results were obtained from running the Multi Criteria Analysis (MCA) using the DEFINITE package. During the exercise, the CHP technology was ruled out from the start by the stakeholders that judged it as unsuitable for the Lebanese conditions due to its high infrastructure requirements. Accordingly, the MCA exercise was used to score and rank the remaining technologies. Table 10 represents some figures and values related to the technologies that were used in the prioritization exercise. It should be noted that although societal benefits and option sustainability are generally inter-related when discussing advantages of renewable technologies, the emphasis here under societal benefits is on the environmental benefits and remote areas developments through tourism and job creation whereas option sustainability reflects mainly better prices stability and increased security. Table 11 presents the final average scores and ranking of the technologies. The results show clearly that the most feasible technology is CCGT followed by hydro, wind, and PV cells.

Table 10 - Values of selected criteria to technologies

Technologies	GHG reduction potential	Fuel cost*	Capital cost	Additional O&M costs	Option sustainability**	Societal and economic benefits**
	Tonnes CO ₂	USD/MWh	10 ⁶ /MW	USD/MW	Average score	Average Score
CCGT	1,711,106	70	0.4	556,764	1.9	2.0
DG	270,588	209	1.05	358,328	2.0	1.8
Wind	142,612	0	1.9	19,000	2.9	2.1
PV	1,258	0	4	40,000	2.9	3.9
Hydropower	181,507	0	3.5	35,000	2.0	3.8
Biomass	102,492	50	5	284,700	3.2	3.4

*average cost of fuel feeding the grid

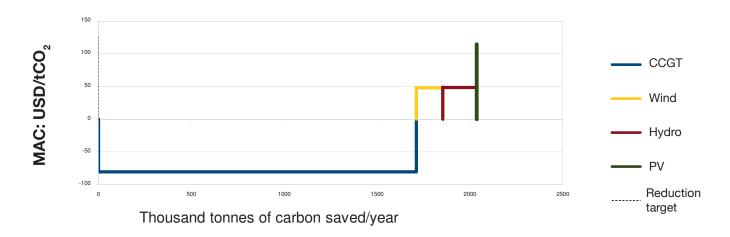

** as scored by stakeholders, 5 for being the best and 1 for being the worst

Selection criteria	Weight	CCGT	DG	Wind	PV	Hydro	Biomass
				Weighed I	relative sc	ore	
GHG reduction potential	0.30	0.300	0.047	0.002	0.000	0.032	0.018
Fuel cost	0.30	-0.010	-0.030	0.000	0.000	0.000	-0.007
Capital Cost	0.15	0.000	-0.021	-0.049	-0.117	-0.101	-0.150

Total weighted (relative) score		0.195	-0.059	0.037	0.008	-0.015	-0.049
	1st	6th	2nd	3rd	4th	5th	

Table 11 - Weighed average scores and ranking of technologies

When using the Marginal Abatement Cost (MAC) (Fig. 4) to compare and evaluate the selected technologies, the ranking of the top 4 technologies slightly changes, prioritizing hydropower over PV technology. This can be explained by the fact that MAC takes only into account the greenhouse gas reduction potential with its respective costs, while

the MCA includes another social and institutional dimension to the assessment, which favors in this case the PV technology over hydropower. Nevertheless, the two methodologies do converge to one ranking of the 4 priority technologies that are to be assessed in this project.

4.3 Barrier Analysis and Enabling Framework

After having identified and prioritized through country-driven participatory processes, the technologies that can contribute to mitigation goals of Lebanon, while meeting the national sustainable development goals and priorities, this section aims at identifying barriers hindering the acquisition, deployment, and diffusion of the prioritized technologies and specifying activities and enabling frameworks to facilitate the transfer, adoption, and diffusion of these selected technologies in Lebanon.

4.3.1 Preliminary targets for technology transfer and diffusion

The main target is to find the technologies that would reduce GHG emissions in addition to helping the country meet its commitment of 12% renewable energy mix by 2020.

The government policy commits to launching, supporting and reinforcing all public, private and individual initiatives to adopt the utilization of renewable energies to reach 12% of electric and thermal supply by 2020. To make this reality and encourage renewable resources, the MoEW is seeking a substantial amount of financing and benefit from CDM and other market mechanism with the collaboration of the Ministry of Environment and other carbon financing schemes for the implementation of renewable energy project.

4.3.2 Methodology

To identify barriers to the technology transfer in the power sector, a general classification has been established, based on a desk review of relevant research, similar projects and initiatives in developing countries and neighboring states in addition to a thorough analysis of successes and failures of previous national projects that tackled these specific technologies. Accordingly, a list of all types of market barriers, both technical and nontechnical was drafted for stakeholders review and validation. This process resulted in the drawing of problem trees specific to each technology and consequently, the consent on a series of measures that would facilitate the transfer of the assessed technologies. Stakeholders included representatives from the MoEW, EDL, ESCOs, industries, academic institutions, and NGOs as well as international organization, a diversity that ensured a complete integrated approach on assessing the power sector problem in Lebanon.

4.3.3 Generic Barriers for the Power sector

Many of the barriers hindering the deployment of alternative and renewable technologies could be considered "market distortions" that unfairly discriminate against these technologies, while others have the effect of increasing their costs relative to the existing technologies (Beck and Martinot, 2004). As a result, renewable or alternative technologies are put at an economic, regulatory, or institutional disadvantage relative to conventional forms of energy used for power generation.

Barriers for the power sector in general in Lebanon include subsidies for conventional forms of energy, high initial capital costs coupled with lack of fuelprice risk assessment, imperfect capital markets, shortage of expertise or information, poor market acceptance, technology prejudice, financing risks and uncertainties, high transactions costs, and a variety of regulatory and institutional factors. Table 12 gives a summary of the main barriers, their key characteristics, and typical measures adopted in many countries to overcome these barriers.

	Barrier	Key characteristics	Typical measures	Relevanc	e		
				CCGT	Wind	PV	Hydro
Institutional	Outdated legal framework	 Regulation based on industry tradition laid down in standards and codes not in pace with developments. EDL in control of electricity generation, transmission and distribution. Insufficient legal framework in Law 462, that inhibits independent power producers to invest in power production and sell power to the utility or to third parties. 	 Amend Law 462. Induce regulatory reform. Propose performance based regulation. Establish of a Feed- in-Tariff scheme. Set the platform for fruitful collaboration amongst governmental entities. 	Х	X	X	X
	Weak institutional structure	 Aging staff and administration at EDL. Ban on employment at EDL. Incompetent staff. Financial deficit. 	 Amended law 462 for the corporatization of EDL. Gradual introduction of the private sector into EDL through service providers law and new independent power producer (IPP) Attract new expertise through a regular employment process. Update existing governance and management bylaws. Introduce institutional reforms to establish a clear energy strategy for the country, and for proper implementation of feasible and marketable alternatives. 	X	Х	X	X
	Liability insurance requirements	• Small IPP feeding into the utility grid under "net metering" provisions may face excessive requirements for liability insurance.	 Proper equipment standards can prevent islanding. Prohibit utilities from requiring additional insurance beyond normal homeowner liability coverage. 		х	х	Х

L

	Barrier	Key characteristics	Typical measures	Relevanc	е		
				CCGT	Wind	PV	Hydro
	Restriction on siting and construction	 Renewable energies may face building restrictions based upon height, noise, or safety. Competition for land use with agricultural, recreational, scenic, or development interests accompanied by substantial increases in property can also occur. Urban planning departments or building inspectors not familiar with the technology and siting requirements. 	 Familiarizing urban planning departments or building inspectors with renewable energy technologies. Establishing procedures for dealing with siting and permitting. Modern architecture to integrate renewable in the design. 		X	X	Χ
Institutional	Transmission access for IPP	 Utilities may not allow favorable transmission access to renewable energy producers, or may charge high prices for transmission access. New transmission access to remote renewable energy sites may be blocked by transmission- access rulings or right-of-way disputes. Safety and power- quality risk from non- utility generation is a legitimate concern of utilities. In turn, the transaction costs of hiring legal and technical experts to understand and comply with interconnection requirements may be significant. 	 Granting transmission access (FIT). Sorting right-of-way disputes. Policies for uniform interconnection standards. Subsidies offered for private industries to create in a competitive market. The subsidy can be delivered either by offering higher prices than those available commercially or by creating a cost increment by issuing certificates confirming the origin and then obliging the power utility or service providers to buy at these tariffs. 		X	X	Χ

	Barrier	Key characteristics	Typical measures	Relevanc	е		
				CCGT	Wind	PV	Hydro
Institutional	Insufficient political awareness	 Large number of decision makers and local authorities are not aware that renewable and alternative technologies could play a supportive role in the social and economic development of the country. Conflicting information on cost and efficiency make the private sector hesitant to participate in the sector operation. 	 Promotion campaigns Capacity building and training. New development objectives. Pilot projects implementation projects. 	X	X	Х	X
Financial	Fuel subsidies	• Costs associated with alternative technologies are at a disadvantage since fuel costs are generally subsidized and life-cycle costs are not adopted.	 Regulation to internalize 'externalities' or remove subsidies. Special offsetting taxes or levies. Removal of subsidies. externalities Integration into fuel market cost. 	Х	Х	Х	Х
	High capital cost	 Initial cost may be high threshold. Imperfections in market access to funds. 	 Third party financing options. Private sector involvement. Special funding. Adjust financial structure. 	Х	Х	Х	Х
Ē	Buyer's risk	 Perception of risk may differ from actual risk (e.g. 'pay-back gap'). Difficulty in forecasting over an appropriate time period due to rapid and unexpected changes in global fuel prices. Investors may have knowledge gaps and high uncertainties is estimating the payback periods for their investments, especially in renewable technologies. 	 Long term fuel import agreements with regional countries. Routines to make life-cycle cost calculations easy. 	Х	Х	Х	X

	Barrier Key characteristics		Typical measures	Relevance			
				CCGT	Wind	PV	Hydro
Financial	Difficult access to credit	 Consumers or project developers may lack access to credit to purchase or invest in renewable energy because of lack of collateral, poor creditworthiness, or distorted capital markets. In rural areas, "microcredit" lending for household-scale renewable energy systems do not exist. According to some banks, available loan terms are mostly at retail level, and may be too short relative to the equipment or investment lifetime. 	 Loan with sufficient terms to match the equipment or investment lifetime. Honoring long-term power purchase agreements to buy the power. 		Х	Х	X
Economic	Unfavorable power pricing rules	 Renewable energy sources feeding into an electric power grid at distribution level are underpriced, and regarded as an intermittent discontinuous source. Two factors are considered: first, renewable energy generated on distribution networks closer to final consumers rather than at centralized generation facilities may not require transmission and distribution. Utilities, however, tend to pay rates that do not account for this feature. Second, renewable power is often an intermittent discontinuous source whose output level depends on factors that cannot be controlled. Therefore utilities may tend to regard r power as a non- reliable resource and hence reduce their purchase prices. 	 Pricing should account for transmission losses and maintenance costs. Tariff restructuring including fossil fuel subsidies removal. Price reform will lead to more rational use of electricity. Financial incentives should be provided to encourage investments in alternative and renewable energies. Economic incentives can be used to encourage investment by reducing the investment cost directly. Fiscal incentives to reduce the cost indirectly through an appropriate taxation system. Tax deductions are most attractive to those who pay most tax. The state should normally obtain benefits from either set of incentives because the subsidies paid to EDL will be reduced with the drop in reliance on fossil fuels for power generation. 		Х	Х	X

	Barrier	Key characteristics	Typical measures	Relevance			
				CCGT	Wind	PV	Hydro
Economic	Transactions costs	Costs of administering a decision to finance, purchase and use renewable and alternative technologies due to performance uncertainties.	 Reliable independent information sources. Convenient & transparent calculation methods for decision making. 	Х	Х	X	×
	Environmental externalities	• Environmental impacts of fossil fuels result in real costs to society, in terms of human health. Dollar costs of environmental externalities are difficult to evaluate and depend on assumptions that can be subject to wide interpretation and discretion. Investors rarely include such environmental costs in the bottom line used to make decisions.	Quantification of the social cost of carbon.	Х	Х	Х	Х
Technological	Commerciality and competitiveness of technologies	• This is Influenced by the monopoly powers that reduce incentives to innovate and erect barriers that may discourage investments. On the other hand, the immaturity of some technologies coupled by ignorance of stakeholders of its potential benefits may restrain the marketability of new technologies.	 Sector restructuring. Incentives. Testing facilities. R&D. Skilled labor for regular maintenance. Availability of local supportive manufacturing facilities. 	Х	Х	Х	Х

	Barrier	Key characteristics	Typical measures	Relevanc	е		
				CCGT	Wind	PV	Hydro
cal	Technological development	 Absence of technological infrastructure to support the expansion of the renewable energy market. 	 Small industries should be established and supported to manufacture spare parts and components for renewable energies in order to compete with export. This measure would lead to substantial reduction in the operation and maintenance costs. It is also necessary to provide trainings to the labor forces mainly for O&M of the plants, establish testing facilities, and set codes for installation in addition to standardization and labeling. 		X	X	Х
Technological	Shortage of Information and standardization	• Availability and nature of a product must be understood at the time of investment.	 Standardization. Labeling. Promotion campaigns. Codes for installation. 	Х	Х	Х	х
ē	Shortage of relevant skilled labor force and expertise	 New technologies are still developing and there is a need to keep in pace with evolving systems and equipments. They also may lack up-to- date information about the technology characteristics, economic and financial costs and benefits, wind and geographical resources, installation and operating experience, maintenance requirements, and sources of finance. 	 Training for technical staff. Special trouble-shooting training for operation and maintenance. 	X	X	X	X

The Power Sector

	Barrier	Key characteristics	Typical measures	Relevance			
				CCGT	Wind	PV	Hydro
Technological	Scarcity of cleaner energy resources	• Some alternative resources may not be easy to obtain such as natural gas for CCGT, or wind and hydro power.	 Long term agreements for NG import. Infrastructure for storage and distribution. Accurate data base on availability of renewable resources. 	Х	Х	Х	×
	Political Instability	• The implementation of mitigation plans are impacted by political alliances and frequent changes in government. Strategies and decisions to restructure the power sector are lost in the political turmoil and the ever changing governance and alliances of political parties.	 Long term strategy to be approved and implemented. Strengthen institutional procedures. 	X	X	X	X
Political	Corruption	• Almost 25% of the generated electricity is not paid for, which leads to irrational, and excessive electricity consumption. It also reduces the income of the power utility, making it more difficult to adopt and invest in new renewable and alternative technologies.	 Proper law enforcement. Automation of the billing system. Remote sensing- based billing. Stopping political interference. 	Х	Х	Х	Х

4.4 Analysis of prioritized technology: Combined- Cycle Gas Turbines

In a combined- cycle gas turbine (CCGT) plant, a gas turbine generator generates electricity and the waste heat from the gas turbine is used to make steam to generate additional electricity via a steam turbine which enhances the plant efficiency to levels around 45% to 55%. CCGT is considered in the MoEW Policy paper as an economically feasible option by using natural gas in the existing CCGT units in Beddawi and Zahrani, and for building new plants that can run on natural gas. The supply of natural gas from the regional countries, namely Syria and Egypt has been interrupted due to political events in these countries. Moreover, the import, storage and distribution of natural gas amongst the local market required an infrastructure with a very high capital cost.

4.4.1 Identification of barriers

Some of the generic barriers identified in Table 12 are more significant with regards to the deployment and diffusion of the CCGT technology, namely:

High capital cost: The initial capital cost needed for the infrastructure of a modern gas storage and distribution network is high and beyond the financial capability of the Government. Since 2 CCGT plants already exist in Lebanon, the initial capital cost is mainly related to the cost of the pipeline infrastructure, which is estimated at USD 1.5 million/km for the 180 km needed to be covered. The contribution of the private sector is highly anticipated in order to share the cost with the government and expedite the diffusion of this technology.

Insecure supply of natural gas: Lebanon relies totally on the import of different types of fuels including natural gas. Although the Government has made several agreements with regional countries such as Syria and Egypt, the supply has been discontinued for several reasons. Moreover, Lebanon is yet to be connected to the regional network for natural gas that is established to distribute gas amongst several regional countries. Gas and oil exploitation from the Mediterranean coastal territories is not expected to start in the near future. It would take another decade before exploitation can actually begin.

Lack of local expertise in CCGT technologies: Two existing CCGT power plants, Beddawi and Zahrani, are being contracted for foreign firms for the operation and management due to the lack of local expertise needed to operate CCGT units.

Absence of supporting infrastructure: CCGT is a new technology for Lebanon, and its deployment would require supporting infrastructure such as connecting network, testing laboratories, skilled labor for regular maintenance, and availability of local manufacturing facilities to support minor modifications and supply spare parts.

Unfavorable electricity tariff: The economic hardship over the past decades has forced a freeze on the electricity tariff in Lebanon. This low tariff has imposed on EDL, and on the Lebanese government, an annual deficit of around \$1.5 billion. Moreover, this low tariff constitutes a major barrier facing the participation of the private sector in the operation and management of the power industry due to the extended payback periods.

The consequences of the barriers facing CCGT technology include:

- High generation cost due to the reliance on diesel oil as a generation fuel since Diesel Oil has an average cost of 0.23US¢/kWh while the shift to natural gas will drop the cost to 0.09US¢/kWh.
- The use of Diesel Oil in CCGT units leads to more rapid deterioration of the units. Diesel oil combustion required more frequent and more costly maintenance.
- Excessive GHG emissions associated with Diesel Oil combustion since the latter has a carbon dioxide emission rate of 778g/kWh compared to 443g/kWh for natural gas.

The root cause analysis is conducted using the problem tree method that determines the major barriers facing the deployment of CCGT as a GHG mitigation option. The highlighted points by no means present all the constraints, their causes, and impacts. The focus is on the main issues. Fig. 3 reflects the results of root cause analysis for the barriers facing the deployment of CCGT technology as a GHG mitigation option.

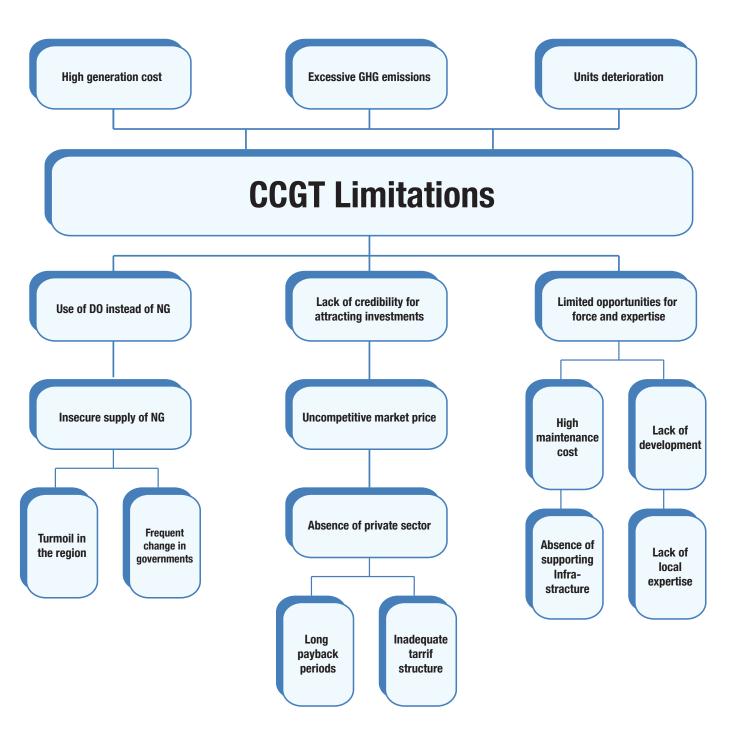

Fig. 5 Root cause analysis for CCGT.

4.4.2 Identification of measures

Among the generic measures proposed in Table 12, financial reforms are the most significant to overcome the barriers linked to the deployment of the CCGT technology. Pricing reform would produce much substantial motivation for the private sector and industrial end-users and household consumers to invest and to ensure the system operated as efficiently as possible. The sector must be rigid and financially viable to attract investors since private investment would not be attracted to a utility that has a yearly deficit of more than 1.5 billion USD.

Removal of Subsidies on Fuel: The current subsidized tariff system does not motivate private sector to participate in the sector. Tariff restructuring or removing the subsidies strategy will include the amendments of the national energy pricing system through a number of measures which reduces the economic burden of the power sector and allows eventual private power producers to sell their electricity at higher tariff. EDL must calculate the revenue requirement tariff to break even and thus calculate the yardstick tariff. Consequently, a modern tariff structure is to be proposed and implemented, preferably including the following criteria:

- Categorize customers based on voltage level and the type of consumer (residential, commercial, etc.)
- Introduce the time of use of energy
- Add Fuel Cost Adjustment formula (FCA)

It is worth noting that the tariff structure also heavily depends on the metering and billing philosophy.

According to a new structure, independent power producers will submit a tender through and international bidding round (transparent) where the winner will be the one with the lowest life time cycle cost – levelized cost (including or excluding fuel, this depends on the type of the contract).

Provision of financial incentives: Financial incentives should be provided to encourage investments in the infrastructure needed for the import, storage, and distribution of natural gas in the country. These projects are characterized by high capital cost and therefore both economic and fiscal incentives are required to support the deployment of CCGT.

Incentives or financial risk reduction may come in

several forms that would encourage the private sector to bid in Lebanon. Risks that need to be carefully considered and mitigated to attract the private sector:

- 1. The political risk: will increase price by increasing the rate of return to recap the investment as soon as possible.
- 2. The credit risk: The dire financial situation of the power sector makes it non-creditworthy for potential investors and lenders.
- 3. Fuel supply: Fuel procurement is currently undertaken by EDL and paid for by the Government to a large extent, it is the reason of 90% value of the subsidy. In this context, a private investor in new generation capacity may prefer to have an Energy Conversion Agreements (ECAs) instead of a PPA. The substantive difference between these is that a PPA has a fuel component while an ECA does not. Under an ECA, the investor is responsible for converting provided fuel into electricity and any potential fuel interruption is outside of the responsibility of the investor. It is important to note however that it is not necessary to have a fuel component (as in a PPA) to hold investors responsible for the plant heat rate (i.e., the efficiency of fuel usage). In international experience, PPAs are much more common than ECAs, but ECA are used where fuel supply is under a monopoly and/or the risk of fuel supply is considered to be better managed by the public entities. In any event, all power plants that are constructed in Lebanon should be dualfired otherwise the non-availability of gas would threaten the sustainability even of an ECA.
- 4. The regulatory risk: it is important that the Government finalize the arrangements and establishes the planned Energy Regulatory Authority as soon as possible. The existence of a regulatory agency would also help strengthen the transparency and accountability of power sector regulation and provide sector leadership in events of changes in government and in Energy Ministers in particular.
- 5. Foreign-exchange risk: The mismatch therefore between the revenue currency and the currency of financing of sector investment by the private sector in a context of weak macroeconomic prospects as perceived by lenders is a major issue for raising private financing for the power sector.

40

Institutional reforms: This includes amending Law 462, and setting the platform for fruitful collaboration amongst the governmental entities. Electricity Law 462 calls for the unbundling of Lebanon's power sector and the creation of a regulatory authority. Several amendments to the law 462 are being currently discussed to allow for future plan expansions, make provisions for the feed- in tariff for co-generation, and call for the introduction of a transition period during which the corporatization of EDL will take place. It shall also call for the gradual introduction of the private sector into EDL through service providers law and new independent power producer (IPP) to build and operate new CCGT units.

Awareness initiatives: International organizations such as UNDP, have already implemented projects with a main objective of conducting awareness campaigns and capacity building activities. The private sector should be targeted to promote the benefits and profits that could be obtained from the participation in establishing and operating new CCGT power plants. The private sector could also participate in the infrastructure for the import and storage of natural gas.

Technological development: In order to engender substantial reduction in the operation and maintenance costs of the CCGT technology and hence encourage its market development, small industries should be supported to manufacture spare parts and components for the CCGT. Some demonstration projects have already been initiated and supported in order to shape domestic technology expertise, link suppliers to the industry, and to create examples of best practice.

4.4.3 Action Plan for the deployment of Combined-Cycle Gas Turbines

Target for Technology Transfer and Diffusion

CCGT is considered by GoL as an economically feasible option for generation expansion and GHG mitigation, especially with the high potential of extracting natural gas in marketable quantities from the Lebanese territories in the Mediterranean. The target is to operate the Zahrani and Beddawi plants using CCGT instead of the current use of Diesel by 2015.

The measures identified in this process could be distributed as shown in Table 13.

4.5 Analysis of Technology: Wind Power

The wind farm concept is yet to be deployed in the country. According to the wind atlas for Lebanon recently published by CEDRO, the potential for wind power generation is estimated at around 6.1 GW including offshore facilities, with the northern regions of Akkar being the most appropriate in terms of wind availability.

Lebanon used to have a strong wind measurement system, but it was mostly destroyed and the records lost during the civil war. As of November 2007, there were seven complete synoptic stations for meteorological measurement, all reporting wind speeds and directions, but the equipment lack proper calibration and their locations are affected by various construction that affect the accuracy of the readings (CEDRO, 2011).

4.5.1 Identification of Barriers

Some of the generic barriers identified in Table 12 are more significant with regards to the deployment and diffusion of the wind technology, namely:

Initial capital cost: The initial capital cost of wind power is generally higher than conventional energy sources, resulting in cost-driven decisions and policies that may renounce the technology as a mitigation strategy. A true comparison must be made on the basis of total lifecycle costs that account for initial capital costs, future fuel costs, future operation and maintenance costs, decommissioning costs, and equipment lifetime. Large subsidies for fossil fuels can significantly lower final energy prices, putting renewable energy at a competitive disadvantage if it does not enjoy equally large subsidies. The capital cost for the installation of wind turbines in Lebanon is estimated at USD 1.9 Million/MW.

Absence of feed-in tariffs: Due to the high capital cost of renewable energy technologies, the private sector is not encouraged to be involved in the deployment of such technologies. With most of the country connected to the national grid, PV is not economical compared to the grid produced electric energy at the present low tariff. PV energy is only competitive when compared to private generation that uses diesel oil. The electricity tariff is still low and is actually below the average production cost of electricity. A feed-in tariff has not yet been in place that can stimulate the market and encourage investments in RE. **Restrictions on siting and construction:** Wind turbines and large scale farms may face building restrictions based upon height, aesthetics, noise, or safety, particularly in urban and semiurbanized areas. Wind turbines have faced specific environmental concerns related to siting along migratory bird paths and coastal areas.

Absence of transmission access for independent power producers: Transmission access is necessary for private power producers because some renewable energy resources, mainly the potential sites in Akkar are somehow far from population centers.

Lack of expertise: Potential private wind power producers may be ignorant of the technology potential and benefits. They may also be faced with conflicting information and data about the wind regime in the country, leaving them with decisions not in preference to the new alternative. Consumers, managers, engineers, architects, and other stakeholders still lack information about wind despite the recently published wind atlas.

Lack of local spare parts manufacturing industries: Little incentives have been developed to promote the manufacturing of RE systems and products. The companies that provide services in RE are numerous but not all of them are experienced. Equipment suppliers currently import all kind of products without quality control and taxes on the imports of RE products and systems have not been waived yet

Fig. 6 shows results of the root cause analysis for wind power. Common causes and impacts of renewable technologies have been identified earlier.

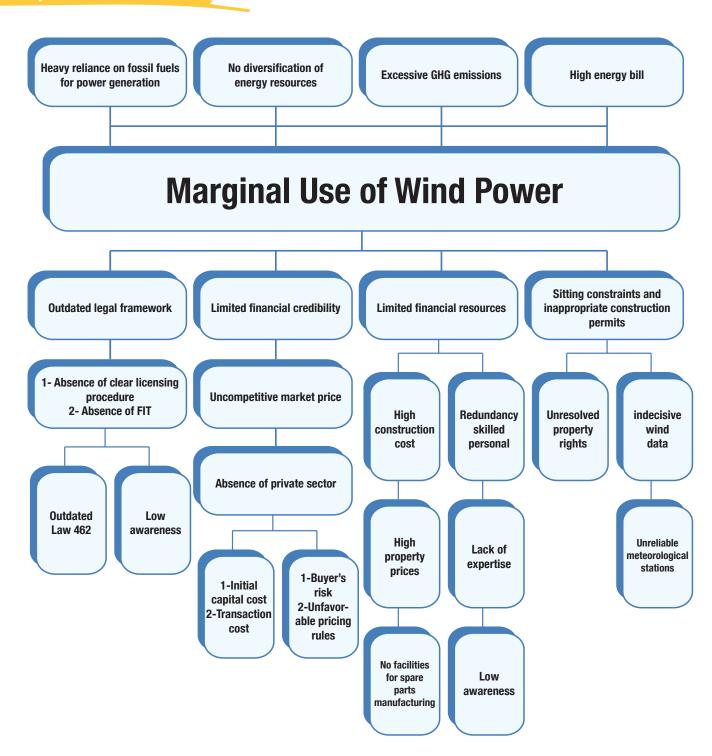

Fig. 6 - Root cause analysis for wind power

4.5.2 Identification of measures

Among the generic measures proposed in Table 12, price reforms would produce much substantial motivation to industrial end-users and household consumers to invest and to ensure the system operated as efficiently as possible. Significant measures for the deployment of wind technology include:

Removal of subsidies on fuel: The current electricity tariff needs to be revised to reflect the actual cost of electricity production and distribution and to subsequently encourage the use of renewable energy technologies. Until the tariff is adjusted, it is very hard to see private investments in RE. The projects already taking place stem from the desire to overcome electricity rationing and are not based on economic merit. The main objectives of tariff restructuring are to minimize the financial burden on EDL through the removal of subsidies and to ensure an adequate impact of future policies for promoting alternative and cleaner energy technologies that are currently at a cost disadvantage. Gradual tariff adjustment by GoL is expected to reach around 50% increase by 2015. This will also allow private power producers to sell at higher profit-making tariff. Moreover, tariff restructuring will lead to more rational use of electricity in the long-run leading to substantial reduction in GHG emissions

Provision of financial incentives: Financial incentives need to be set by the banking sector to encourage investments in the renewable technologies market in the country.

Feed-in tariffs: When the average tariff of the utility is corrected and set at the yardstick tariff to achieve a break even for the utility, then several RE technologies will become economically viable especially if feed-in tariff with incentives is further adopted for RE suppliers.

Institutional reforms: The environment needed to accelerate the penetration of any Renewable Energy into the market has not been installed yet. The Law 462 which was recently amended to facilitate the introduction of RE has not been approved by the Cabinet of Ministers and so it may be long before it is ratified by the Parliament. Several amendments to the law 462 are being currently discussed to allow for future plan expansions, and for the penetration of renewable energy technologies. The amended law is expected to make provisions for the feed- in tariff for cogeneration, and should call for the introduction of a

transition period during which the corporatization of EDL will take place.

Technological development: Small wind power- related industries should be established and supported to manufacture spare parts and components for wind power in order to compete with imported spare parts leading to substantial reduction in the operation and maintenance costs. This can be achieved by exchange of experience and capacity building with neighboring countries and other industrialize countries with relevant experience in the field. Facilities such as permitting privileges and easy credit access should be put in place in close collaboration with the Ministry of Industry to encourage the establishment of such industries.

4.5.3 Action Plan for the deployment of Wind Power

Target for Wind Technology Transfer and Diffusion

The policy paper has set a target of up to 100MW wind power production to be financed by the private sector by 2015. The capital cost is estimated around USD 1,950/kW, whereas the additional cost due to its implementation as a mitigation technology is around USD 950/kW. The consultation meetings with stakeholders revealed a significant interest in wind power in the private sector.

The main identified measures as obtained from the stocktaking process are presented in Table 14.

Chapter 4

4.6 Analysis of Technology: Photovoltaic cells

The manufacturing of photovoltaic (PV) cells has grown and advanced considerably in recent years on global scale, up to a total capacity of 40 GW at the end of 2010, distributed in more than 100 countries (REN21, 2011). This growth has been accompanied by a significant drop in the material and electronic system cost. In Lebanon, The UNDP-CEDRO project has managed to complete the installation of 126 kW for schools, municipalities and community centers. Such a progress may trigger additional penetration of PV into the Lebanese market if supported by other initiatives. The Lebanese territory is rich in solar radiation, and therefore with proper policies and incentives, paralleled with global drop in manufacturing cost could witness widespread outside major cities. Like wind power, PV cells are expected to replace or supplement the operation of diesel private generators mainly in the residential sector.

4.6.1 Identification of barriers for PV cells

The policy paper for the electricity sector did not include energy production from PV technology but it committed to start a pre-feasibility study on PV farms. The reason could be due to the high capital cost, low efficiency of PV systems and the false belief that PV cannot make a contribution if widely implemented in decentralized mode along with the new concept of net-metering in Lebanon. With most of the country connected to the national grid, PV is not economical compared to the grid produced electric energy at the present low tariff. However, the PV produced energy is competitive when compared to private generation that uses diesel oil.

Some of the generic barriers identified in Table 12 are more significant with regards to the deployment and diffusion of the PV technology, namely:

High capital cost: The initial capital cost of PV cells and supplementary technologies is substantially higher than conventional energy sources, resulting in cost-driven decisions and policies that may discriminate against PV cells as an economically feasible mitigation strategy. Moreover, large subsidies for fossil fuels do significantly lower final fuel- driven energy prices, putting renewable energy, mainly PV cells, at a competitive disadvantage if it does not enjoy equally large subsidies. In addition to the subsidies barrier, renewable energy investments from the private sector generally may face high taxes and import duties on the components. Although capital cost has been declining over the past years, the current price is still the highest of all alternative technologies, estimated at USD 4 Million/MW.

Inadequate tariff structure: The current tariff structure of electricity is very low and does not represent even the actual cost of energy production. Until the tariff is adjusted, it is very hard to see private investments in RE. The projects already taking place stem from the desire to overcome electricity rationing and are not based on economic merit. Even with tariff adjustment, there is an urgent need to introduce feed-in tariff to encourage investments in the field of RE.

Inadequate net metering system: The already introduced net-metering scheme has to be updated so as to allow for income making from the sale of RE to the grid. As it stands now, the users can benefit from bill reduction when injecting energy into the grid. However, if energy sale exceeds the energy purchased from the grid, the customer cannot cash the balance. Until there is a reliable electricity supply, net metering will continue to suffer from the inability to inject continuously into the grid (when rotating outages are in place) and hence to utilize the energy produced, storage batteries are necessary. Such storage increases considerable the cost of RE systems.

Restrictions on siting and construction: PV installations may face building restrictions based upon height, space availability on building facades, or safety, particularly in multi-store buildings in urban areas.

Absence of transmission access: Transmission access is necessary for private PV power producers because some sites of potential PV plants may be located in remote or semi- urbanized regions and to allow direct third-party sales between the renewable energy producer and a final consumer.

Low awareness: Most decision makers are not aware of the social, economical and environmental benefits of that renewable technologies and do not consider them as high priorities in the development plans. In addition, although many citizens and institutions support the development of RE but many of them do so without being backed by the minimum level of awareness and education about the characteristics of those products

Root cause analysis results are shown in the below figure.

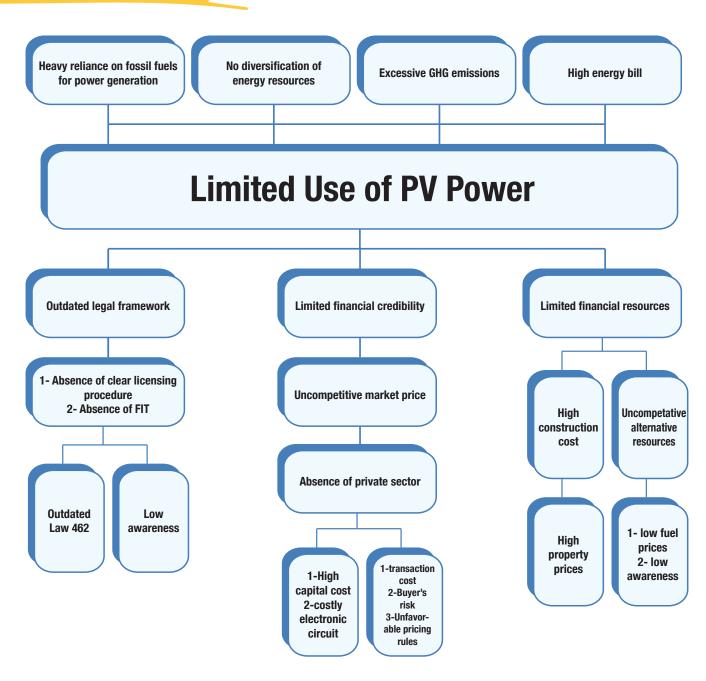

Fig. 7 - Root cause analysis for PV cells

4.6.2 Identification of measures

Knowing that PV cells currently have the highest capital cost of all listed renewable technologies, then price reforms certainly provide high motivation for private industrial end-users and household consumers to invest and to ensure that their investments will be economically feasible. Among the generic measures proposed in Table 12, financial and technical support are the most significant, and they include:

Removal of subsidies on fuel: The main objectives of tariff restructuring are to minimize the financial burden on EDL through the removal of subsidies and to ensure an adequate impact

of future policies for promoting alternative and cleaner energy technologies that are currently at a cost disadvantage. Gradual tariff adjustment by GoL is expected to reach around 50% increase by 2015. This will also allow private power producers to sell at higher profit- making tariff. Moreover, tariff restructuring will lead to more rational use of electricity in the long-run leading to substantial reduction in GHG emissions.

Provision of financial incentives: Economic and fiscal incentives can be used to encourage investment. Significant support so far has been focused on promoting solar hot water heating systems, a proven technology that can make a useful contribution to GHG reduction. LCEC has been active in promoting solar thermal water heaters in the Lebanese market, providing advice on technical issues, communication and marketing. A similar momentum should be created to the PV systems. CEDRO has carried out a project for the deployment of PV cells for street lighting and for a number of schools in different regions of Lebanon.

Feed-in tariffs: For a power grid operator, PV renewable energy technology is of much higher capital cost, and therefore must be subsidized if it is to be developed by private industry in a competitive market. Even with tariff adjustment, there is an urgent need to introduce feed-in tariff to encourage investments in the field of RE. Investors need to have the opportunity to sell excess energy to the grid and consequently cash the balance.

4.6.3 Action plan for the Deployment of Photovoltaic cells

Target for Technology Transfer and Diffusion

In Lebanon, the CEDRO project has started installing PV cells in around 25 public schools and community centres in different parts of the country with a total capacity estimated between 1.2 and 1.8kW.The Council for Development and Construction is developing a pilot project farm with nominal capacity ranging between 1 and 5MW (MoEW, 2012). In conducting the generation capacity expansion till year 2015, a total of 1MW of PV cells has been considered.

The stocktaking process has identified the measures for PV technology as listed in Table 15

4.7 Technology Analysis: Hydropower

Hydropower is a combustion- free energy resource which is well established on global scale, and in Lebanon. Hydroelectric power plants have long economic lives, with some plants in Lebanon still in service for 50–100 years. Hydropower could, therefore, provide a feasible mitigation option for a limited replacement of fuel- driven thermal units since the hydro power capacity in the country could be increased by around 40MW. Hydro power has been established in Lebanon for a long time, since the 1960s, and therefore, unlike other renewable resources, local expertise is already available in hydro projects like Abdel Al and others.

4.7.1 Identification of barriers

Some of the generic barriers identified in Table 12 are more significant with regards to the deployment and diffusion of the hydropower technology, namely:

High capital cost: The capital cost for building the infrastructure needed for a hydro power plant could be very high compared to other conventional energy sources, resulting in cost-driven decisions and policies that may renounce hydro power as an economically feasible GHG mitigation strategy. The investment cost is further inflated by the rising trend of property prices in the country. The capital cost for hydropower has been estimated to USD 3.5 million in Lebanon.

Outdated legal framework: Renewable energy sources feeding into an electric power grid may not receive full credit for the value of their power. Renewable energy resources such as hydro power are often regarded as an intermittent discontinuous source whose output level depends on water availability that cannot be entirely controlled. Therefore utilities tend to regards these renewable resources are not reliable and hence reduce their purchase prices.

Inadequate water authorities regulations: In Lebanon, all water resources and rivers are considered to be a state property. In these circumstances, and in the absence of a legal framework, independent power producers will not have enough incentives and motivation to invest in hydro power facilities.

Unresolved property rights and shortage of landscape: Unresolved property rights in many regions of the country, state ownership for rivers and water resources, and dams for hydro power, may lead to restrictions on implementing such projects. Current city planning regulations may not allow for private hydro power production amongst water resources. Also they may not have established procedures for dealing with siting and permitting. Competition for land use with agricultural, recreational, scenic, or development interests, accompanied by substantial increases in property prices and scarcity of water for several months every year, can also be a barrier for the wide spread of hydro power. Fig. 8 shows the results of the root cause analysis for hydro power.

4.7.2 Identification of measures

Among the most important measures are price reforms that would produce much substantial motivation to industrial end-users and household consumers to invest and to ensure the system operated as efficiently as possible. Measures for financial support and other measures have been discussed in Table 12, and they include:

Removal of Subsidies on Fuel: The current electricity tariff needs to be revised to reflect the actual cost of electricity production and distribution and to subsequently encourage the use of Hydropower energy technologies. Feed-in Tariffs: due to the high capital cost of renewable energy technologies, the private sector should be encouraged to be involved in the deployment of such technologies.

Institutional reforms: they include the establishment of a clear energy strategy, clarification of roles and responsibilities of all involved entities and amend Law 462. It also includes the enforcement of safety standards, city planning intervention for setting property rights throughout the country and setting clear procedure for licensing and assessment.

Technological support: this includes the provision of training for the labor force mainly in O&M in

hydropower, creating incentives to develop local supportive manufacturing facilities and thus reduce cost of import, establishing measurements and testing facilities, and developing codes for installation and standardization and labeling.

4.7.3 Action plan for the deployment of Hydropower

Target for Technology Transfer and Diffusion

The target is to generate additional 40MW from hydro resources by year 2014 and generate up to 30 MW from the rehabilitation of existing hydro plants. Major measures for the hydro power sector are listed in Table 16.

Table 17 shows a summary of the priority of various mitigation measures for the proposed technologies. "1" indicates highest priority. Removal of fuel subsidies is regarded as a high priority measure for all mitigation technologies. Implementing this measure would facilitate large scale deployment of clean and renewable resources in the country. Also, feed- in- tariff is of high priority for the 3 renewable resources.

4.8 Cost Benefit Analysis

Fig. 9 shows the levelized production costs of the existing thermal power plant. Evidently, the 66-MW plant of Tyre and the 99-MW plant of Baalbeck, both run on diesel, have by far the highest production costs combined with inefficient generation and excessive GHG emissions.

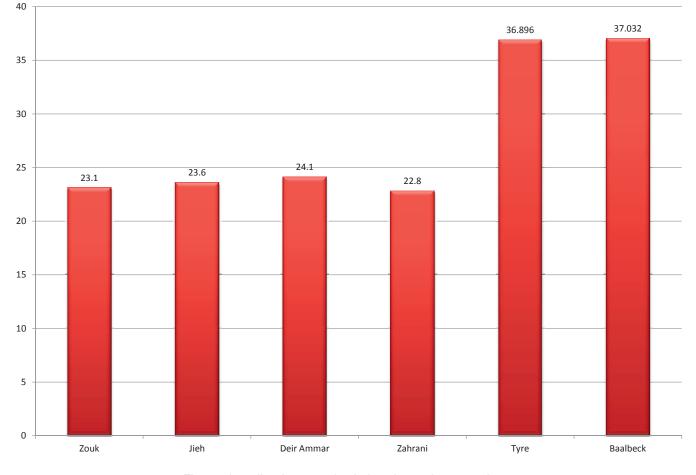

The baseline scenario presented in the previous part of the report discussed the mitigation options, and the outcomes of implementing these options of the total national GHG emissions. To provide more specific cost analysis, 4 cost benefit scenarios are studied here:

- i. Replacing Tyre DO plant with wind power.
- ii. Replacing DO with natural gas for running the CCGT units in Beddawi and Zahrani.
- iii. Replacing Tyre and Baalbeck DO plants with hydro power.
- iv. Replacing Tyre DO plant with PV plants.

The results of the cost benefit analysis, as listed in Table 18 show that all the above scenarios provide a win- win opportunity in leading to saving in the generation cost, coupled with significant drop in GHG emissions.

4.9 Linkages of the barriers identified

Linkages of the identified barriers are being highlighted in the on-going amendments of the law 462 aimed at meeting current national requirements, future plan expansions, and to allow for the penetration of renewable energy technologies. These will include a temporary scheme of licensing the sale of renewable power through the feed- in tariff for co-generation. To constitute an enabling activity, the feed-in tariff has to be above the opportunity cost of electricity. The amended law should also call for the introduction of a transition period during which the corporatization of EDL will take place. It shall also call for the gradual introduction of the private sector into EDL through service providers law and new independent power producer.

4.10 Enabling framework for overcoming the barriers in the Power sector

The enabling framework for overcoming the barriers in the power sector are common for all 4 technologies and include the following:

1. Amended Law 462

Several amendments to the law 462 are being proposed and are currently discussed by the Government to make the law more applicable to present Lebanese conditions, to future plan expansions, and to allow for the penetration of renewable energy technologies. A temporary scheme of licensing the sale of renewable power even for a small- scale generation should be considered.

The amended law is expected to make provisions for the feed- in tariff for co-generation. To constitute an enabling activity, the feed-in tariff has to be above the opportunity cost of electricity. If the feedin tariff is above the marginal cost of electricity at subsidized fuel prices, but below the opportunity cost then it is simply a regulation to correct the monopoly purchasing power of the network and the distorted fuel prices.

The amended law should also call for the introduction of a transition period during which the corporatization of EDL will take place, It shall also call for the gradual introduction of the private sector into EDL through service providers law and new independent power producer (IPP) to build and operate new CCGT units.

2. Coordination amongst governmental entities

There are several governmental entities involved in planning for the power sector; the MoEW, the Higher Council for Privatization and the Council for Development and Reconstruction (CDR). Decisionmaking normally proceeds through the general processes available in the executive and legislative branches of the government, and if necessary, will be passed to the Parliament for discussion and approval. These entities should have much closer

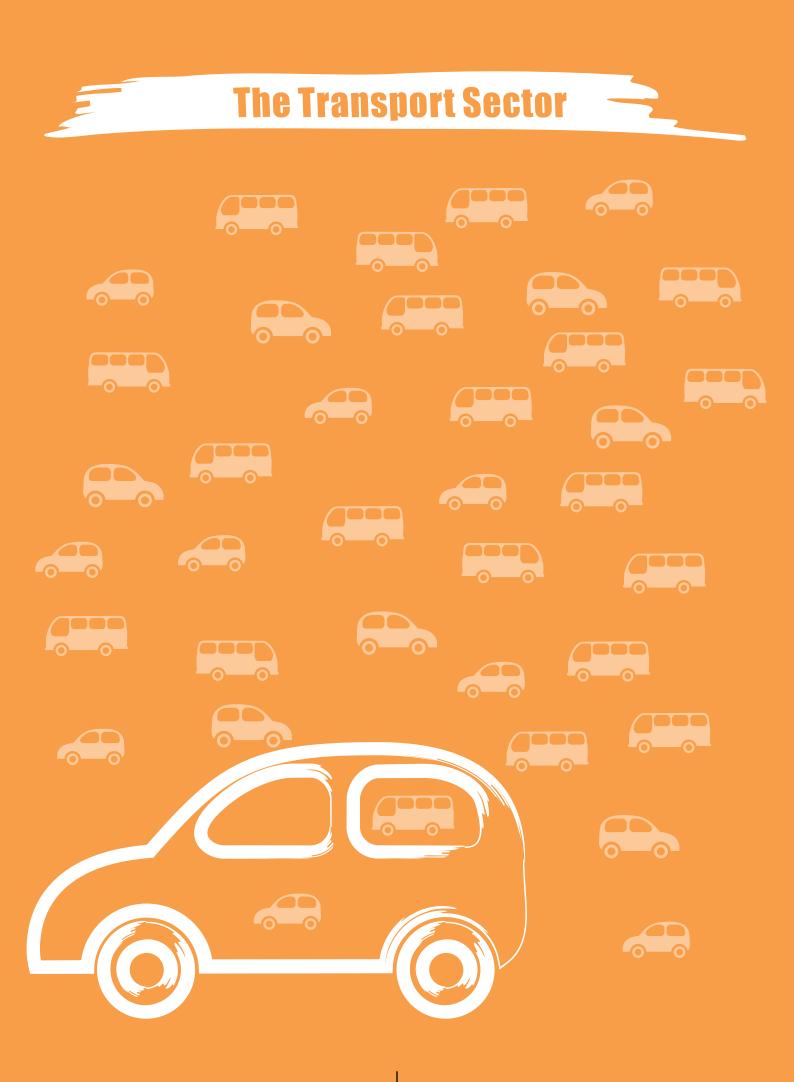

collaboration for achieving a fruitful and rapid progress in setting the legal reforms needed for the alternative technologies and renewable energy market.

3. Benefit from New Market Mechanisms

The New Market Mechanisms can offer operating support to projects through the provision of a market for the certificates of Carbon Emission Reduction or by providing the opportunity to finance mitigation project though bilateral or multilateral funding. Although still not clearly defined under the UNFCCC, the new market mechanisms can be used through an enhanced post-2012 CDM, or though the preparation and of NAMAs, to support the deployment of clean and alternative technologies in the power sector by either the EDL or by the private sector.

4. Capacity Building

International organizations such as UNDP, have already implemented in Lebanon projects and entities such as the LCEC, with a main objective conducting awareness campaigns and of capacity building activities. Such initiatives have been recently expanded with the clear objective to gradually transfer the responsibility for the implementation and continuation of the campaigns to the Lebanese government. The MoEW policy paper has set a target of having by year 2020, 12% of power generated from renewable resources [NEEAP]. Moreover, the LCEC has published recently the National Energy Efficiency Action Plan (NEEAP), for the upcoming years 2011-2015, that constituted 14 initiatives for the spreading renewable as well as energy efficient technologies. Besides providing awareness for renewable energy and energy efficiency, the campaigns should include capacity building elements, such as training seminars or workshops, to educate officials of relevant Lebanese authorities in designing and implementing effective and efficient policies for renewable energy and energy efficiency.

I

5.1 Sector overview

5.1.1 Scope of work

The scope of work in this TNA project embraces the road passenger transport sector, since it dominates all modes of transport in Lebanon and consumes the most energy produced by petroleum products. According to statistics from the International Energy Agency in 2008, the oil consumption of the road transport sector constituted more than 60% of the total oil consumption, 99.2% of which is gasoline (IEA, 2008). In terms of emissions, it accounts for nearly 21.4% of Lebanon's GHG emissions for the year 2000, and it is the main source of CO, NO_x and NMVOC emissions, with 94%, 59% and 66% respectively (MoE/UNDP/GEF, 2011).

The scope of this TNA project includes the road passengers' transport while freight, maritime and air transport are left out due to data unavailibility.

5.1.2 Road passengers' transport sector existing conditions

Reviewing past and current mobility assessments for the Lebanese road transport sector, passengers' mobility demand has experienced a real explosion since 1990, particularly in Greater Beirut Area (GBA), and the trend is strongly upward over the decade to come. This growth is mainly attributed to the raise of daily passenger trips and the increase of car ownership.

Traffic volume growth

GBA, which extends from Nahr-el-Damour south to Nahr-el-Kalb north, encloses more than 40% of the population of Lebanon, and 1.5 million of daily passenger trips estimated in 1994, expected to reach 5 million in 2015 (MoE/UNDP/GEF, 2011). Traffic conditions in GBA can be described as mostly congested, with a daily traffic volume of 230,000 passenger-car-unit crossing the north coastal highway and 85,000 the southern highway (Afif, 2012; Waked et al., 2012), and delays at some intersections ranging from 5 to 30 minutes (MoE, 2005).

Vehicle fleet overview

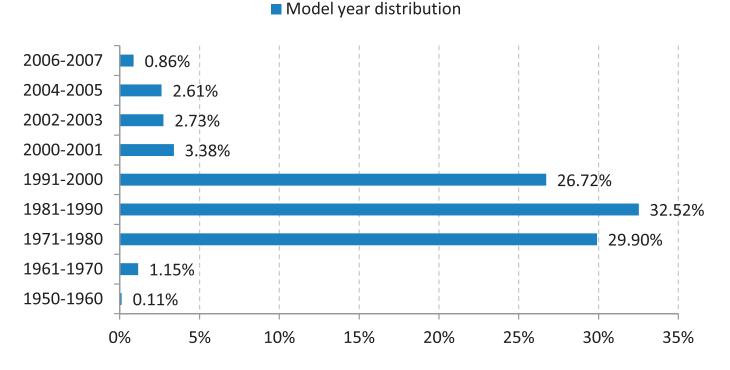

The current land transportation system mainly rely on vehicles, particularly private passenger cars that share in 2007 around 80% of the 1.55 million vehicles of the Lebanese car fleet, as indicated in Table 19. The rate of car ownership is estimated to be 3 persons per car in 2002, and the trend is to increase in the next decade with an annual rate of 1.5%.

Table 19 Lebanese vehicle fleet composition in 2007

Passenger cars		1,247,572
Red plate cars	47, 707	
Heavy duty vehicles	183,428	
2/3-wheelers	70,699	
Agriculture vehicles	210	
	Total	1,549,616

Source:(MoE/UNDP/GEF, 2011)

The passenger cars fleet is old with an average age exceeding 13 years. 63% of the fleet is older than 20 years and 90% older than 10 years as indicated in Fig. 10. Moreover, the vehicle engine distribution shows that the fleet is mostly inefficient, since 60% of the cars have engine displacements exceeding 2.0 liters, while only 8% have engines less than 1.4 liters (Fig. 11).

I

Fig. 10 - Lebanese vehicle fleet age structure in 2007.

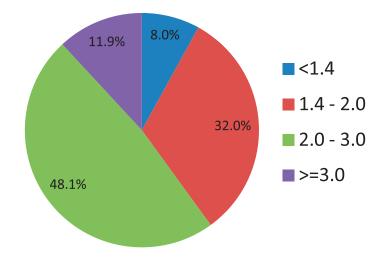

Fig. 11 - Engine displacement distribution of the Lebanese car fleet in 2007.

Public transport overview

Mass transport systems in Lebanon are generally characterized by being inefficient, unreliable and cost-ineffective. It relies on public and private buses, private vans and minibuses, and exclusive and shared ride taxis, operating without any coordination. In 2002, the mass transport market share in GBA was 31%, split between modes as illustrated in Fig. 12 (MoE, 2005). In 2007, the database of registered vehicles shows that the number of mass transport vehicles registered is 55,875, with 47,707 exclusive and shared taxis.

Contrary to the high number of mass transport vehicles, occupancy rate of mass transport systems is low, as indicated in Table 20.

Driving conditions overview of passenger cars in GBA

Based on collected data from on-road measurements in GBA through GPS survey with different drivers, the GBA driving conditions in 2011 are characterized by the following:

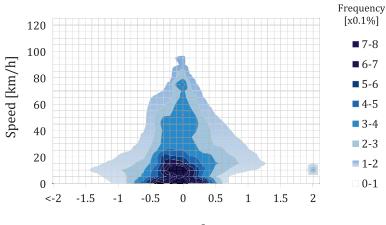

- 50% of total trips have a total distance lower than 5 km and 75% lower than 12 km, with an average trip distance of 9.6 km.
- 25% of stops are below 2 seconds and 75% below 10 seconds.
- Stop time corresponds to more than 15% of travel time.

This statistical survey reflects the low driving range in GBA with high rate of congestion and high rate of short time stops. Moreover, the speed acceleration frequency distribution presented in Fig. 13 shows that the acceleration rates are significant at very low speed, which result in an inefficient operation of internal combustion engines; thus leading to a high rate of fuel consumption and pollutant emissions in conventional gasoline powered vehicles.

All these existing conditions have led the road passengers' transport sector to have a high passenger transport energy intensity in 2007, estimated at 3.08 MJ/passenger-kilometer (Fig. 14), in addition to having a high energy demand of 15.06 GJ/capita, exceeding the world average (Fig. 15).

As a result, GBA passengers are suffering from high budget required for transport, high dependence on fossil fuels, in addition to alarming pollution rates particularly in urban areas. Therefore, road passengers' transport is a key sector for reducing the total fuel consumption and emissions of Lebanon.

5.1.3 Actions at sectoral level

Existing policies and Measures

The main existing transport legislation relevant to the mitigation of GHG emissions comprises:

Rules/Policies/Regulations	Description
Decree No. 124/2003	Specifications of motorcycles and engines, and allowed time to drive, applied in all areas of Lebanon.
Decree No. 8243/2003	Mandatory Annual vehicle inspection.
Decree No. 11244/2003	Set up Traffic Management Organization (TMO) which has yet to carry out a technical traffic management role rather than just an administrative one.
Decree No. 7858/2002	 Incentives to renew the fleet such as exempting new cars, 5 years old cars, public transport cars, and buses of no more than 24 passengers from import tax, and registration, and inspection fees. Compensate owners of private cars, public transport cars, and buses which would convert to gasoline engines with amounts ranging from 1,000,000 to 13,000,000 L.L depending on the year of manufacture. Ban the use of private and public cars of diesel engines starting from 15/6/2002. Ban the use of private and public transport autobuses of diesel engines starting from 15/7/2002. Ban the use of public buses of 16 to 24 passengers of diesel engines starting from 31/10/2002. Designate the port of Beirut and Tripoli for collecting the replaced engines until they are exported outside Lebanon.
Decree No. 8442/2002	Specifications of fuel motor vehicle; diesel oil and gasoline 92, 95 and 98 octane.
Law 341 (6/08/2001)	The law lays the legal framework for reducing air pollution from the transport sector and encouraging the use of cleaner sources of fuel. Specifically, the law bans the import of minivans operating on diesel engines, as well as old and new diesel engines for private passenger cars and minivans. The law empowered the GoL to retrieve 10,000 public license plates operating on diesel.
Council of Ministers decision 9, on 5/4/2000	The decision calls for the reform and reorganization of the Land Public Transport Sector in Lebanon and the reduction of the number of public transport vehicles from 39,761 to 27,061 vehicles.
Decree 6603 (4/4/1995)	It defines standards for operating diesel trucks and buses, as well as the implementation of a monitoring plan and permissible levels of exhaust fumes and exhaust quality (particularly for CO, NO _x ,hydrocarbons and TSP).

5.1.4 Mitigation strategies

Based on the prevailing conditions in the Lebanese road transport sector, reducing GHG and pollutant emissions from passengers' transport means (per passenger-kilometer) has become a must, which implies reducing the dependence on fossil fuels. The objective of this TNA report is to identify and prioritize technologies that contribute to mitigating emissions and fuel consumption in road passengers' transport.

Reviewing the existing conditions in the passenger transport sector, several factors need to be

considered for mitigation: (1) reduce the number of passenger cars, (2) reduce the number and length of trips, (3) increase the vehicle occupancy rates, (4) increase mass transit means, (5) improve the vehicle efficiency, (6) increase the use of low carbon fuels, (7) increase urban average traffic speed.

Based on these mitigation factors, it is clear that no single measure will provide the solution and that action is needed simultaneously through different mitigation strategies. The priority strategies identified for consideration in Lebanon seek to:

- Revitalize the public transport systems
- Renew the existing car fleet through a scrappage programme
- Optimize the use of existing and planned road networks

However, the implementation of these strategies won't be successful without the adoption of enforcing strategies and policies:

- A well defined transport demand management system, based on shifting demand toward low carbon modes through pricing incentives and disincentives
- Legislative reforms regarding urban planning laws, expropriation laws, taxes and tariffs, traffic and driving laws

Fig. 16 reviews the process for reaching the objective of reducing the GHG and pollutant emission levels from transport sector.

Many ongoing projects aim at improving road networks, particularly the Urban Transport Development Plan for the city of Beirut, implemented by the Council for Development and Reconstruction (CDR). It consists of implementing a traffic management system, an on-street parking management system, a corridors improvement programme, and an establishment of the Traffic Management Organization (TMO) (MoE, 2005). Hence, the mitigation strategies to be considered in this TNA will focus on the remaining two strategies: revitalizing the public transport and renewing the existing car fleet.

The associated mitigation technologies to each of the two strategies are illustrated in Fig. 17, classified under "bus technologies for public transport", "advanced powertrains for passenger cars" and "alternative fuels for passenger cars".

5.2 Possible mitigation technology options in the transport sector and their mitigation benefits

This section highlights the characteristics of the identified mitigation technologies presented in Fig. 17, in addition to their energy consumption savings and environmental benefits comparing to Business As Usual (BAU). Two reference scenarios are considered in the analysis: the Lebanese average fuel consumption of its passenger cars fleet in 2007 under GBA driving conditions (11.16 l/100km) (Mansour et al., 2011) and the world average feul consumption of new car fleet in 2005 (8.07 l/100km) (IEA, 2011). The objectives are to identify the benefits relative to the existing conditions in GBA and its old fleet, in addition to highlighting the benefits relative to a complete new vehicle fleet with recent technologies dating 7 years.

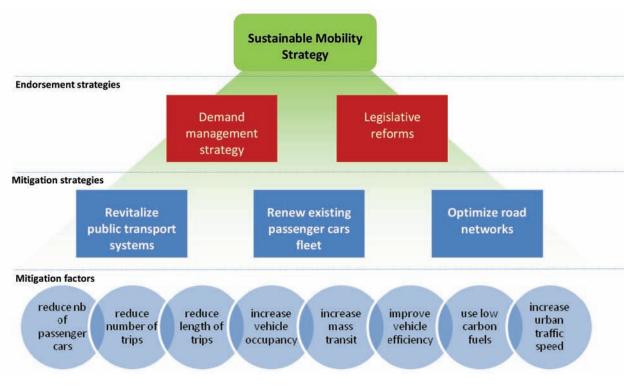

Fig. 16 - Process for reducing emissions from transport sector.

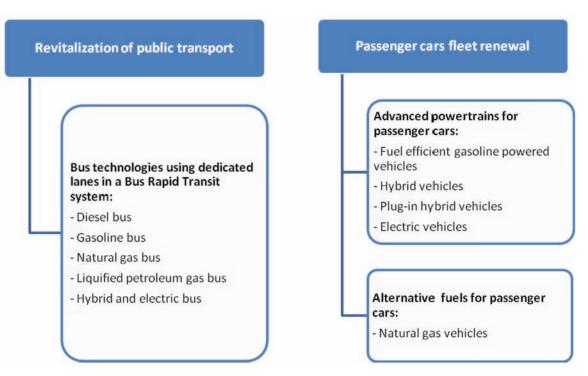

Fig. 17 - Mitigation technologies to be prioritized for each mitigation strategy.

5.2.1 Assessment methodology

In the context of assessing energy consumption and emissions savings of the identified mitigation technologies relative to the existing Lebanese road passenger transport means, results from end-of-life on-road measurements have been used, in addition to simulation results from specific powertrain simulation and life-cycle-analysis tools. These tools were used in order to bypass the complexity of real world measurements and obtain results reflecting the Lebanese existing conditions. Specific models are developed and validated for the purpose of this TNA and adapted to the existing conditions of road passengers' transport in GBA.

In fact, different variables need to be considered for assessing the consumption and emissions in real driving conditions, such as road gradient, stop duration, use of accessories, driver behavior, routes length, driving situation chronology and weather condition (Zgheib, 2009). Moreover, the variables in driving conditions are unique for every geographical area because of the variation of the road network topography, traffic congestion, car fleet composition and driving behavior in the underlying region (Andre, 2004). Accordingly, specific driving cycles emulating the Lebanese driving conditions in GBA are built for the purpose of this TNA, based on on-road measurements through GPS data logging (Mansour et al., 2011; Mansour and Zgheib, 2012).

Consumption results have served in assessing the operating costs of each of the technologies, according to its associated energy price. Other cost assessment issues such as maintenance and additional purchase costs have been determined from the literature and market review.

5.2.2 Bus technologies

Technology characteristics

Though diesel buses are still the most used bus technology worldwide, several bus technologies have made a breakthrough in public transport services, relying on different sort of fuels other than diesel. Among them are alternative fuel buses operating on CNG, LNG and LPG, and electric driven buses.

Bus public transport is a real mean to short-term solution to the environmental pollution issues in Lebanon, particularly when bus technologies are coupled to a well designed transport demand management system and dedicated lanes, like the Bus Rapid Transit (BRT) system.

Bus public transport with dedicated lanes contribute to the following aspects of sustainable developments: (1) improvement of air quality, (2) reduction of GHG emissions, (3) congestion reduction, (4) increase in energy supply security due to reduction of imported oil, (5) social equality and poverty reduction by providing affordable transport with lower operating costs than passenger cars per passenger-kilometer, (6) economic prosperity by reducing travel times and congestion. However, bus technologies not coupled to dedicated lanes and a well-defined demand management strategy lead to negative impacts on the environment and the traffic, case of the current conditions of public transport in GBA.

Fuel consumption and GHG emissions reduction potention

The passenger-kilometer efficiency of bus technologies is higher than that of the passenger cars, which is the main reason why public transport can lower the GHG and pollutant emissions of road traffic and reduce the total energy use. Nevertheless, this efficiency differs largely with the type of fuel used and the bus occupancy. Fig. 18 and Fig. 19 illustrate the passenger-kilometer efficiency and CO_2 emissions of different bus technologies as function of their occupancy. Results are compared to the average efficiency of the Lebanese car fleet in 2007, with 1, 1.5, 2 and 3 pass/veh.

In Lebanon, passenger cars occupancy is estimated to be lower than 2. Therefore, diesel, gasoline, CNG and electric driven buses would present a better efficiency and lower CO_2 emissions as their occupancy exceeds 10 to 15 pass/veh. 40.9 and 80.3% of CO_2 savings are observed with diesel buses with occupancy of 10 and 30 pass/veh respectively, comparing to Lebanese passenger cars fleet of 2007, under GBA driving conditions.

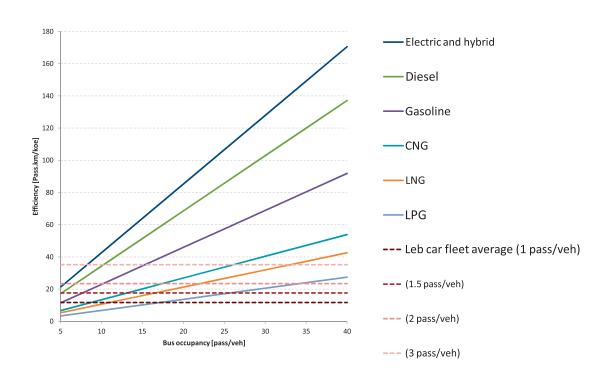

Fig. 18 - Efficiency of bus technologies as function of bus occupancy, relative to the Lebanese average passenger cars efficiency, with 1, 1.5, 2 and 3 pass/veh occupancy.

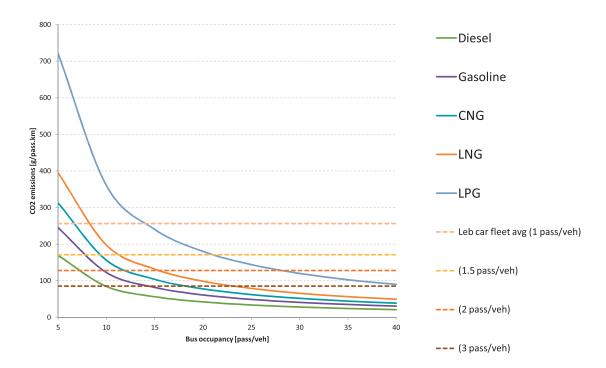

Fig. 19 - CO₂ emissions of bus technologies as function of bus occupancy, relative to the Lebanese average passenger cars CO₂ emissions, with 1, 1.5, 2 and 3 pass/veh occupancy.

5.2.3 Fuel efficient gasoline powered vehicles

Technology characteristics

Fuel efficient vehicles are commonly known by conventional gasoline powered vehicles with low consumption (estimated lower than 6.5 l/100km). These vehicles are equipped with advanced technologies and present advantages of consumption and emissions reduction comparing to similar gasoline vehicles within same vehicle segment (two-seaters, subcompact, compact, mid-size, full-size, station-wagon).

The advanced technologies are classified as passive and active systems, illustrated in Fig. 20. Passive systems have indirect impact on reducing fuel consumption, such as reducing the vehicle weight; and active systems have direct impact on consumption reduction such as engine downsizing, idle stop/start systems and continuous variable transmissions.

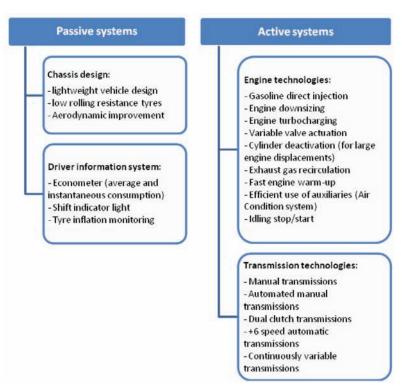

Fuel efficient gasoline powered vehicles are characterized by the following:

• No major modifications within the power train (similar to conventional vehicles); hence, drivers don't have to adapt their driving techniques to these new technologies.

- Technologies can be applied on the basis of modular flexibility where different combination of features (listed in Fig. 20) can be observed.
- With the addition of stop/start systems, combinations of technologies and the use of turbo charging technology to downsize the engine lead to 15-25% improvement compared to current gasoline engines.
- Additional costs are observed according to the added features, but remains cheaper than alternative technologies like hybrid vehicles.

Potential for reducing fuel consumption and GHG emissions

Considerable consumption and CO_2 emissions savings are observed with fuel efficient vehicles for all vehicle segments, as indicated in Table 21. These savings range from 10 to 50% comparing to the world average new cars fleet of 2005, and from 35 to 64% comparing to the Lebanese average consumption of the passenger cars fleet in 2007 under GBA driving conditions.

I

Fig. 20 - Passive and active system technologies of fuel efficient gasoline powered vehicles.

Table 21 - Fuel consumption and CO₂ emissions of fuel efficient gasoline powered vehicles, compared to Lebanese average existing cars fleet (in 2007) and to world average new cars fleet (in 2005).

Vehicle segment	Fuel efficient gasoline powered vehicles 2011	Fuel consumption on combined cycle	CO ₂ emissions	Fuel and CO ₂ savings relative to world average 2005	Fuel and CO ₂ savings relative to Lebanese fleet 2007
		(l/100km)	(g/km)		
Two- seaters	45 kW - Manual 5spd	4.2	97	48.0%	62.7%
Mini- compact cars	63 kW - Manual 5spd	4	92	50.4%	64.7%
Sub- compact cars	74 kW - Manual 6spd	5.2	120	35.6%	53.9%
Compact cars	73 kW - Manual 6spd	5.8	135	28.1%	48.1%
Midsize cars	90 kW - Manual 6spd	6.7	155	17.0%	40.5%
Large cars	115 kW - Manual 6spd	7.3	168	9.5%	35.5%
Station- wagons	90 kW - DCT 7spd	6	139	25.7%	46.6%

Average CO_2 emissions of the Lebanese existing fleet in 2007 is estimated 260.4 g/km under GBA driving conditions. Average CO_2 emissions of the world new cars fleet in 2005 is estimated 188.3 g/km.

Source : (ADEME, 2011; Mansour et al., 2011).

5.2.4 Hybrid electric vehicles

Technology characteristics

Hybrid electric vehicles (HEV) combine an electric motor and battery pack to the internal combustion engine (ICE) found in conventional vehicles. Three powertrain configurations are observed: parallel, series and series/parallel. HEVs are also classified as micro-hybrid, mild-hybrid, full-hybrid, plugin hybrid and range-extender electric vehicles. They are differentiated by the fraction of electric power added onboard; consequently, the ability to achieve more hybrid functions. Note that the more electric energy is available onboard, the more fuel reduction will result, at the expense of additional control complexity and additional purchase cost.

HEVs are characterized by the following:

- More economical to run with consumption lower than 5 l/100 km in compact cars.
- High driving range of about 960 kilometers, twice that of conventional vehicles and six times that of electric vehicles.
- Fewer tailpipe pollutants because of their electric powertrains and efficiently-operated internal combustion engines.
- Downsized internal combustion engine, designed to operate efficiently when meeting

average power needs because the battery intervenes when extra energy is required. In conventional vehicles, the engine is designed to meet peak power needs, thus it is oversized.

- Lower maintenance costs compared to conventional vehicles, estimated from an end-of-life study between 0.6 and 1.8 US¢/ km, where the average maintenance cost for conventional vehicles from the same vehicle segment is 2.6 US¢/km (USDOE, 2011). Note that HEVs may need a battery change over the vehicle life.
- Do not require additional infrastructure investments.

Fuel consumption and GHG emissions reduction potential

Hybrid vehicles present significant fuel and CO₂ savings under current GBA existing conditions, as indicated in Table 22. 40 to 53% savings are observed with small to midsize cars. Moreover, the Table highlights the technology advancement in recent years, since 17 to 35% of savings are achievable comparing to gasoline technologies of 2005. On another note, large hybrid cars and SUVs present consumption figures above the world average, but still lower than comparable gasoline car models.

Vehicle segment	Fuel consumption on combined cycle	Fuel and CO ₂ savings relative to world average 2005	Fuel and CO ₂ savings relative to Lebanese fleet 2007	
	(l/100km)			
Sub-compact cars	5.2	35.5%	53.4%	
Compact cars	5.3	34.2%	52.4%	
Midsize cars	6.7	17.2%	40.1%	
Large cars	7.9	2.2%	29.3%	
SUV	10.1	-24.6%	9.9%	

Table 22 - Fuel consumption and CO_2 emissions of end-of-life hybrid vehicles, relative to Lebanese average of 2007 existing cars fleet and to world average of 2005 new cars fleet

Source: (USDOE, 2011).

5.2.5 Plug-in hybrid electric vehicles

Technology characteristics

A plug-in hybrid electric vehicle (PHEV) is an extended version of hybrid vehicle, which utilizes rechargeable batteries that can be restored to full charge by connecting a plug to an external electric power source. A PHEV shares the characteristics of both a conventional hybrid electric vehicle and a battery electric vehicle, having a plug to connect to the grid. Therefore batteries of PHEVs have bigger capacities than conventional HEVs.

Regardless of its architecture, a PHEV is capable of charge-depleting and charge-sustaining modes:

- Charge-depleting mode allows a fully charged PHEV to operate on electric power until its battery state of charge is depleted to a predetermined level. This mode is the vehicle's all-electric range mode (AER).
- Charge-sustaining mode is the same operating mode as conventional HEVs.

Once a PHEV has exhausted its AER in chargedepleting mode, it switches into charge-sustaining mode automatically.

PHEVs are characterized by the following:

- Less dependence on fossil fuels: PHEVs are expected to use about 40 to 60% less petroleum than conventional vehicles. The consumption of current prototypes ranges from 2.2 to 4.3 I/100km in combined driving conditions, depending on everyday charging frequency.
- Less GHG emissions: PHEVs emit less GHG than conventional vehicles, but the amount generated depends partly on the fuel used at electrical power plants. Renewable sources are highly recommended rather than the currently used in Lebanon residual-oil-burning power plants, or coal-fired power plants.

- Driving range higher than conventional vehicles, since an engine is still onboard to extend the range of the vehicle once the battery charge is depleted.
- Lower operating costs: though PHEVs will likely cost 5,700 to 7,400 USD more than comparable conventional vehicles, the consumed energy will cost less since electricity is cheaper than gasoline. Incentives will play a decisive role in promoting PHEVs.
- Lower maintenance costs: maintenance costs of PHEVs are similar to HEVs, thus lower than conventional vehicles, due to less use of the engine. However, PHEVs may need a battery change over the vehicle life.

However, serious concerns are faced by PHEVs: the recharging time lasts for 1 to 2 hours and the need of a recharging infrastructure is a prerequisite.

Fuel consumption and GHG emissions reduction potential

Fuel consumption of PHEVs depends on the everyday charging frequency. According to consumption results from on-road measurements on PHEV fleets, around 2.4 I/100km are observed for a charging frequency of 2 times/day and 4.1 I/100km for 1 time/day (Zgheib, 2012). Such results lead to fuel savings up to 78.5% under GBA driving conditions, and up to 55% comparing to their similar HEV versions, as indicated in Table 23.

In terms of CO_2 emissions, the vehicle operation emissions are lowered in the same range of the fuel consumption rates. However, the final CO_2 emission reduction depends strongly on the source of the electricity used. A larger deployment of renewable energy sources would lower the CO_2 emission of the PHEV further.

Table 23 - Fuel consumption of on-road measurement PHEV fleets in Japan and France, relative to Lebanese average of 2007 existing cars fleet and to world average of 2005 new cars fleet

Vehicle segment	Charging frequency	Fuel consumption (I/100km)	Fuel savings relative to world average 2005	Fuel savings relative to Lebanese fleet 2007	Fuel savings relative to simi- lar HEV version
Compact car	2.1 times/day	2.2	70.3%	78.5%	55.1%
	0.9 time/day	4.3	49.2%	63.3%	23.4%

Source: (Zgheib, 2012).

5.2.6 Battery electric vehicles

Technology characteristics

Battery Electric Vehicles (BEV) are propelled by an electric motor, powered by rechargeable battery pack. They derive all the power from the battery pack and thus have no internal combustion engine.

BEV is a real mean to long-term solution to today's environmental and noise pollution issues in GBA. Technological innovations now make it possible to mass market an electric vehicle at reasonable cost. In addition, changes in vehicle use make electric cars ideal for the majority of trips in GBA, since 94% of the trips are lower than 20 km (Mansour et al., 2011).

BEVs offer several advantages compared to conventional vehicles:

- Energy efficient: its electric powertrain converts around 75% of the chemical energy from the batteries to power the wheels, where internal combustion engines only convert 20-30% of the energy stored in gasoline on highways and less than 15% in urban areas.
- Environmentally friendly: BEVs emit no tailpipe pollutants, although the power plant producing the electricity may emit them. Electricity from nuclear, hydroelectric, solar, or wind-powered plants causes no air pollutants.
- Performance benefits: Electric motors provide quiet, smooth operation and stronger acceleration and require less maintenance than ICEs (estimated to be half of an ICE).
- Reduce energy dependence.
- Lower operating costs since electricity is cheaper than gasoline. However, incentives will play a decisive role in promoting BEVs.

However, BEVs face significant battery related challenges:

- Limited driving range to 160 km in current tested vehicles.
- 4 to 8 hours battery recharging time. A "quick charge" to 80% capacity takes 30 min. Note that the concept of quick-drop in battery swap stations is under study.
- High cost of battery since lithium-ion batteries currently range between 800 and 1,000 USD/

kWh. However, battery lease programmes are under study by automakers, starting from around 100 USD per month to cover a driving range of 10,000km/year (CAS, 2011).

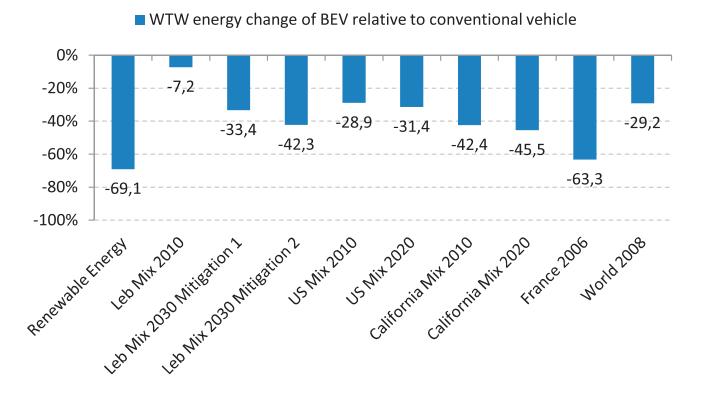

• The need of a battery recharging infrastructure.

Fuel consumption and GHG emissions reduction potential

The energy efficiency of electric cars is very high compared to their fossil fuel counterparts, which lead theoretically to no GHG emissions. Nevertheless, the actual GHG emissions and total energy use associated with the use of BEVs depend largely on the way the required electricity has been produced. Therefore, the well-to-wheel (WTW) analysis must be considered in this assessment.

The WTW energy use improvements of BEVs comparing to WTW average consumption of the Lebanese cars fleet of 2007 are illustrated in Fig. 21. 7.2% of energy savings are achievable under the current Lebanese electricity mix; however, 33 to 42% of savings will be possible in 2030 if mitigation scenarios of electricity generation mix are adopted. These scenarios are summarized in Fig. 22.

Fig. 23 and Fig. 24 outline the WTW GHG and pollutant emissions change of a typical BEV. Note that these emissions are occurring in the Well-to-Pump (WTP) process, no emissions are observed in the vehicle operation process (Pump-To-Wheel). With the current Lebanese electricity production mix, almost no GHG savings are observed with BEV (-0.2%). However, 39.1% and 52.7% of GHG savings are observed with mitigation scenarios for 2030. In terms of pollutant emissions, BEVs can substantially contribute to improving local air quality in GBA apart from NO_x, as shown in Fig. 24.

I

Fig. 21 - WTW energy change of BEV relative to average consumption of the Lebanese cars fleet of 2007.

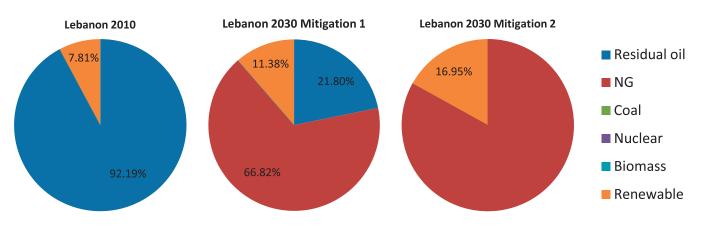

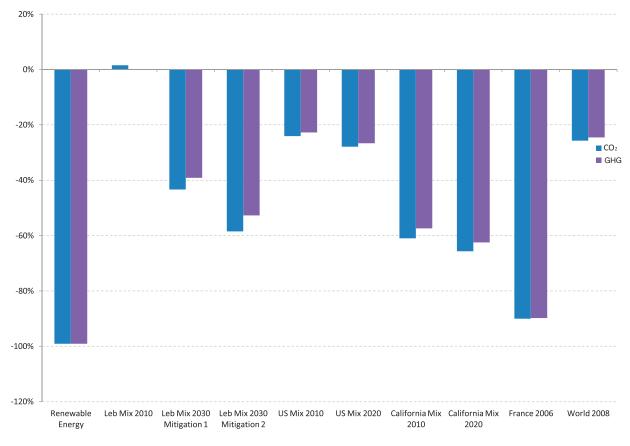

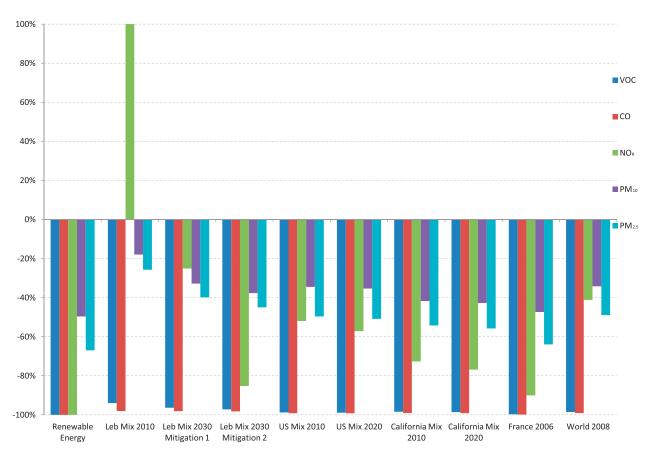

Fig. 22 - Lebanon electricity generation mix Source: (MOE/UNDP/GEF, 2011)

I

5.2.7 Natural gas vehicles

Technology characteristics

A natural gas vehicle (NGV) is an alternative fuel vehicle that uses compressed natural gas (CNG) or liquefied natural gas (LNG) as an alternative to gasoline and diesel. Natural gas is a fossil fuel comprised mostly of methane, and is one of the cleanest burning fuels. In most common applications, it is used in the form of compressed natural gas (CNG) to fuel passenger cars and city buses, and in the form of liquefied natural gas (LNG) to fuel heavy duty trucks. Due to high boil-off evaporative losses, LNG is not recommended for passenger cars and urban buses.

There are both dedicated NGVs which run exclusively on natural gas, and bi-fuel NGVs, which have two separate fueling systems enabling the car to run either on natural gas (CNG) or on gasoline or diesel. Most current CNG passenger cars are bi-fuel vehicles. It is possible to retrofit a gasoline powered vehicle with a natural gas tank. However, these vehicles are not as fuel efficient as OEM (Original Equipment Manufacturers) natural gas powered vehicles. In addition, retrofitted vehicles have higher emissions of NO_v and PM.

NGVs, particularly CNG passenger cars, offer several advantages compared to conventional vehicles:

- CNG vehicles have lower maintenance costs when compared with other fuel-powered vehicles, estimated around 2.1 US¢/km compared to 2.4 US¢/km for similar gasoline vehicles (USDOE, 1999).
- CNG fuel systems are sealed, which eliminates evaporation losses.
- Increased life of lubricating oils, as CNG does not contaminate the engine crankcase oil.
- CNG mixes easily with air, since it is a gaseous fuel, which leads to a clean combustion.
- CNG is less likely to auto-ignite on hot surfaces, since it has a high auto-ignition temperature, which improves the combustion efficiency.
- Less pollution as CNG emits significantly less pollutants such as unburned hydrocarbons, carbon monoxide and particulate matter, compared to conventional gasoline vehicles.

However, CNG vehicles face significant challenges:

they have a higher purchase cost estimated at around USD 2,000, a lower driving range and higher gasoline equivalent consumption (110% for bifuel CNG and 105% for dedicated CNG and LNG vehicles) due to the inferior energy density of NG compared to gasoline, in addition to the need of an infrastructure for NG transportation and distribution. With NG, transportation is still depending on fossil fuels.

Fuel consumption and GHG emissions reduction potential

The Well-to-Wheel (WTW) energy use change of NGV, gasoline HEV and BEV comparing to the WTW average consumption of the Lebanese car fleet of 2007 is illustrated in Fig. 25. Dedicated and bi-fuel NGV technologies are considered, in addition to two different NG transportation paths: (1) the NG feedstock is transported using LNG, assumed to be the intermediate fuel to bring NG to the stations (shown in the figure under "LNG transport"); (2) the NG feedstock is transported in gaseous form.

Three conclusions are drawn from the figure:

- Dedicated CNG vehicles present better efficiency compared to bi-fuel NGV, as they are optimized to operate solely on NG rather than on two fuel types: gasoline and NG.
- Both technologies present energy consumption exceeding the Lebanese average consumption: 2% to 18% of additional energy is consumed with NGV, whereas electrified powertrains bring remarkable consumption savings, up to 28.6% with HEVs. Such result is expected since NG energy density is lower than gasoline. However, the main advantage of NGVs is expected in reducing air pollutants, due to the clean combustion occurring in the engine.
- NGVs using NG transported in liquid form present higher total energy consumption due to the double gas-liquid conversion losses and to boil-off evaporative losses when NG is transported to stations under LNG.

Fig. 26 and Fig. 27 outline the WTW GHG and pollutant emissions change of NGV, gasoline HEV and BEV comparing to the 2007 Lebanese cars fleet.

Taking into consideration the energy needed to extract and refine the fuels, the corresponding WTW CO_2 emissions of NG are lower than for

gasoline. 5% to 20% of CO_2 savings are observed, depending on the powertrain technology and the path for transporting NG feedstock. Nevertheless, considering the rest of GHGs such as CH_4 and N_2O , almost no GHG emissions reductions are observed with NGVs. In contrast, HEV GHG emissions savings can reach 28.4%.

In terms of pollutant emissions, the main pollutant reductions are CO and VOC as NG (methane) has less carbon content and the CNG tanks are sealed, as illustrated in Fig. 27.

Currently, NG is imported in Lebanon from regional countries. Thus, it is convenient to compare also the vehicle operation emissions, as illustrated in Fig. 28. Bi-fuel CNG vehicles present similar CO and VOC emissions comparing to lowemission gasoline vehicles, and much lower than uncontrolled gasoline vehicles. Moreover, dedicated CNG vehicles present even further emissions reduction than low-emission gasoline. However, the uncertainty remains on the NO_x emissions level. According to the literature, NO_x emissions from bifuel NGVs, particularly converted CNG vehicles, may be higher or lower than comparable gasoline vehicles, depending on the engine technology. NO_x emissions from NGVs are more difficult to control using three-way catalysts.

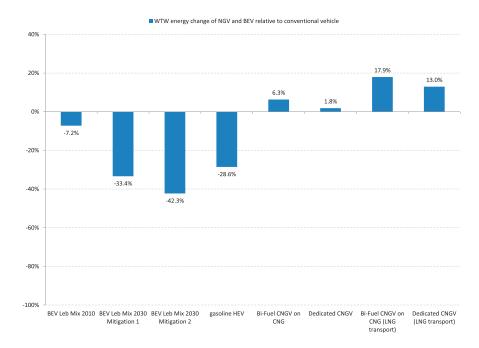

Fig. 25 - WTW energy changes of NGV, gasoline HEV and BEV relative to average consumption of the Lebanese cars fleet of 2007.

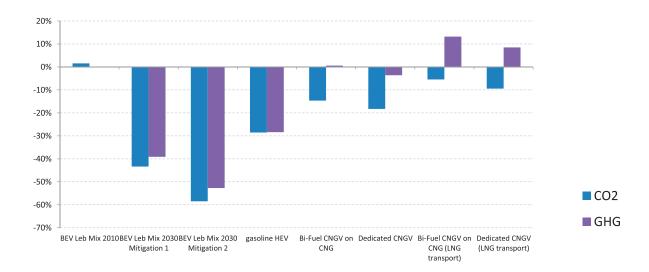

Fig. 26 - WTW GHG emissions change of NGV, gasoline HEV and BEV relative to the Lebanese cars fleet of 2007.

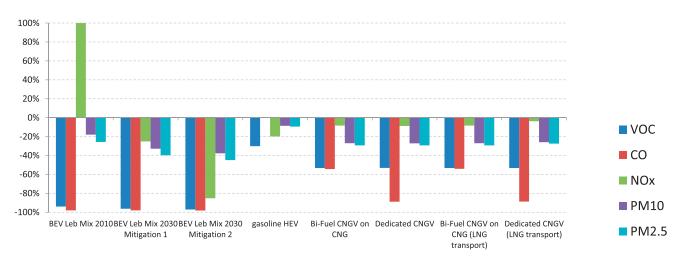

Fig. 27 - WTW pollutants change of NGV, gasoline HEV and BEV relative to the Lebanese cars fleet of 2007 under GBA driving conditions.

5.2.8 Conclusions

This section brings all energy and environmental benefits of identified mitigation technologies into the same scale (Table 24), in order to compare in terms of passenger-kilometer the figures of the studied technologies.

The technologies are classified under the two studied mitigation strategies: (1) renewing the existing passenger cars fleet through a scrappage programme and (2) revitalizing the public transport systems. For passenger cars, a compact vehicle is considered for the different technologies, in order to fairly compare the energy and CO_2 emissions savings.

Note that results are obtained from end-of-life on-road measurements and simulation tools, where specific models are developed, validated and adapted to the existing conditions of road passenger transport in GBA. Therefore, obtained results are specified for the case of Lebanon, and reflect realistic driving consumption and emissions.

5.2.9 Cost analysis of mitigation technologies

Technology prioritization decisions in transport often involve tradeoffs between conflicting technology outcomes. For example, deploying the high efficient electrified vehicles may be reconsidered by stakeholders when investment costs for infrastructure implementation are included in the assessment. Hence, a global comprehensive analysis is considered in this TNA, by providing the environmental and energy benefits on one side, and the associated costs on the other side. This section provides the cost analysis of the different identified technologies in order to rationalize the prioritization decisions.

Mitigation strategies		Renew the existing passenger cars fleet					Revitaliz transport	
	Fuel efficient vehicles	Hybrid electric vehicles	Plug-in hybrid vehicles		Battery Natural electric gas vehicles vehicles		with dedicated	
			Charge	frequency			Bus occupancy	
			2 times /day	1 time /day			15 pass /veh	30 pass /veh
Fuel consumption ⁽¹⁾ (L/100km.pass)	3.19	2.91	1.32	2.25	0.00	4.17	3.80	1.27
Total energy consumption ⁽²⁾ (kWh/100km.pass)	29.34	26.81	17.36	23.49	11.61	38.40	34.99	11.66
PTW CO ₂ savings (%) ⁽³⁾	48.10	52.00	78.49	63.26	100.00	18-25	40.86	80.29
WTW CO ₂ savings (%) ⁽⁴⁾	26.5	28.6	N/A	N/A	-1.5 (43.4-58.5% in 2030)	14.7-18.3	N/A	N/A

Table 24 - Energy consumption and CO₂ emissions benefits of the identified mitigation technologies.

⁽¹⁾ Fuel consumption of comparable compact passenger cars, in liter gasoline equivalent. The vehicle occupancy rate considered for passenger cars is 1.82 pass/veh, observed under GBA driving conditions. Note that average fuel consumption of 2007 Lebanese car fleet is 6.13 L/100km.pass.

⁽²⁾ Fuel and electricity consumption of comparable compact passenger cars, expressed in kWh.

⁽³⁾ Pump-To-Wheel (Vehicle operation) CO_2 savings relative to the average CO_2 emissions of the 2007 Lebanese passenger cars fleet, estimated 260.4 g/km.

⁽⁴⁾ Well-To-Wheel CO₂ savings relative to the average CO₂ emissions of the 2007 Lebanese passenger cars fleet.

Cost analysis methodology

Different transport related types of costs are included in the analysis, as indicated in Table 25 Though the list considered is not exhaustive, it provides a reasonable basis for analyzing major technologies' cost benefits.

Cost analysis of bus technologies with dedicated lanes

Cost benefits

Bus technologies present clear cost savings per passenger-kilometer comparing to passenger cars, as illustrated in Fig. 29 and Fig. 30. In average bus occupancy (15 pass/veh), Diesel and CNG buses present cost savings around 75-83%. These savings could reach 92% during rush hours (30 pass/veh). As for passenger cars, savings could be considered significant only when the car is shared by 4 passengers, as illustrated in Fig. 30.

Note that this assessment is done with different fuel prices, from Egypt, Greece, Turkey, France, Germany and USA, where NG, diesel and gasoline are used for transport, as indicated in Table 26 (NGVA, 2011).

Additional cost to implement bus technologies

According to the Transport Union for Public Transport (UITP), the initial extra capital costs compared to a 12-meter diesel bus at USD 257,000 are summarized in Table 27.

In addition to the cost of the bus technology, public transport systems operate efficiently when using dedicated lanes like in BRT systems. However, BRT requires high investment costs for its infrastructure. Depending on the required capacity, urban context and complexity of the project, BRT systems can be delivered for 1 to 15 million USD/km (IPCC, 2007), with most existing BRTs in developing countries in the lower part of this range (ITDP, 2007). These figures are substantially lower than those for railbased systems, which cost approximately 50 million USD/km (IPCC, 2007).

Table 25 - Transport costs considered in the assessment

Cost	Description
Annual operating cost	Vehicle operating costs, including fuel price spent over one year with a driving range con- sidered 10,000 km. These costs are computed from energy consumption simulation and end-of-life measurement results, using current gasoline and electricity tariffs in Lebanon.
Maintenance cost	Vehicle maintenance costs, including reparation fees. Accident damages are excluded.
Additional purchase cost	Additional costs requested to purchase the vehicle comparing to similar gasoline pow- ered vehicle from same segment.
End-of-life ownership cost	The total ownership cost of the vehicle over 250,000 km, including operation, mainte- nance and additional purchase costs. Purchase and resale car price are excluded.
Infrastructure cost	The infrastructure cost required for bringing the technology to a commercially operable level.

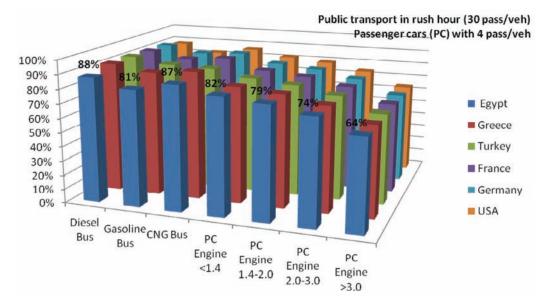

Fig. 30 - Cost savings of public transport buses in rush hours (30 pass/veh) and shared passenger cars (4 pass/veh) relative to Lebanese car fleet average fuel consumption with 1 pass/veh.

Cost analysis of mitigation passenger car technologies

In order to simplify the cost assessment done for the different passenger car technologies, Table 28 brings all results into a comparable scale. Different variables are considered for coming up with cost results coherent with the existing conditions in GBA: the energy consumption estimated under GBA driving conditions, an annual total mileage of 10,000 km and the current fuel and electricity tariffs in Lebanon, considered 1.2 USD/liter and 0.15 USD/kWh respectively.

The results are computed for a compact-size passenger car, with an average occupancy of 1.82 as estimated in GBA.

Combining environmental and energy saving results to the cost benefits, the following conclusions are drawn:

- For revitalizing the public transport systems, diesel and CNG bus technologies coupled to dedicated corridors present the highest development benefits, in terms of energy and environmental benefits, and cost savings. However, efficient pricing and optimized demand management strategy are essential to the well deployment and efficient use of these technologies.
- Under the strategy of renewing the passenger cars fleet, fuel efficient gasoline powered vehicles and self-sustaining hybrid vehicles

present significant energy, emissions and costs savings, with an acceptable additional cost if tax and legislative reforms are applied. These technologies do not require any specific infrastructure investments.

• If additional savings are aimed for, plugin hybrid, battery electric and natural gas vehicles would be the solution, however, at the expense of higher purchase costs and the need of a costly infrastructure for refueling the vehicles. Note that NGVs may benefit from the NG pipeline network to be implemented by the MoEW for providing the coastal power plants with NG.

Table 28 - Cost analysis summary Table

⁽¹⁾ Operating cost savings relative to Lebanese car fleet of 2007. Gasoline price is estimated 1.2 USD/liter and electricity tariff 0.15 USD/kWh.

⁽²⁾ The maintenance cost of conventional gasoline powered compact-segment vehicle is estimated 0.026 USD/km.

⁽³⁾ Leasisng option 100 USD/month.

⁽⁴⁾ End-of-life ownership cost savings relative to Lebanese car fleet of 2007. The passenger cars end-of-life assessment is considered 250,000 km. Purchase and resale car price are excluded.

5.2.10 Criteria and process of technology prioritization

The technology prioritization process for the transport sector is carried out using a Mutli-Criteria Analysis (MCA) decision-making exercise, where transport experts and stakeholders assessed the identified mitigation technologies based on to their importance in meeting national mitigation goals. This section presents the selection process and criteria used in the prioritization exercise.

Selection process

For each identified technology, factsheets were elaborated and disseminated to a wide spectrum of researchers and experts from national and international institutions for review. These factsheets contained detailed information on characteristics. technology institutional and organization requirements, adequacy of use, capital and operational cost, advantages as well as barriers and challenges.

Based on this extensive dissemination process, an expert consultation workshop and individual consultations were conducted to ensure that the opinion and feedback of relevant institutions and experts are taken into consideration.

During the consultation workshop, the proposed weights were validated and the ranking was conducted through an open discussion among the experts and scores were attributed based on general consensus. Rankings were also completed during individual meetings.

Selection criteria

The criteria were selected based on two main objectives: minimizing the GHG and pollutant emissions for the transport sector and maximizing the environmental, social, and economic development benefits.

Accordingly, five main criteria for technologies selection were identified: (1) consistency with national policy and local context, (2) technology effectiveness, (3) technology cost-effectiveness, (4) environmental effectiveness and (5) social acceptability. Each of the criterion is attributed specific sub-criteria and assigned a weight based on its significance in meeting the two objectives, as indicated in Table 29.

The rating values attributed to each criterion were from 0 to 5, and determined by the following:

- 5: high relevance/ high impact
- 3: relevant/ moderate impact
- 1: less relevant/ less impact
- 0: not relevant/ no impact

Results of technology prioritization

Table 30 presents the final scores that were attributed to the proposed technologies of the transport sector. The main points raised during the working group session and the individual meetings revolved around:

- The need to couple the bus technologies with dedicated corridors and to optimize its operation and promote its use through proper policies and measures. Otherwise, bus public transport would bring negative impacts on the traffic, the environment and the economy, as is observed currently in GBA.
- The need to optimize the use of the existing infrastructure by adopting intelligent transport systems in demand management.
- Lebanon needs short timeframe solutions to improve its air quality rather than reduce its GHG emissions, as air pollution has daily direct impact on passengers' health, whereas Lebanon's contribution to world's GHG emissions is insignificant. As a result, it was decided to use a higher weight factor for the criterion of improving the air quality than that of reducing GHG emissions.
- Though electric mobility has proven itself as the future of transport, deployment of electrified vehicles that need to be plugged to the grid is difficult to achieve on the short and medium terms, as Lebanon is in deficit in terms of electricity generation.
- Though OEM Natural gas vehicles are safe to use, uncertified and self-retrofitted NGVs present significant safety concerns. Hence, in the lack of control policies for safety regulation, natural gas will only be considered for use in public transport buses or for electricity generation for electrified vehicles.

As a result, the MCA exercise enabled the selection of priority technologies for the transport sector in Lebanon. The top-ranked technologies are 1) Bus technologies using diesel and natural gas for revitalizing the public transport, 2) Hybrid electric vehicles and 3) Fuel efficient gasoline vehicles for renewing the passenger cars fleet. Table 29 - Criteria and weights for the prioritization process.

Criteria	Weights	Comments				
Consistency with national policy and local context:						
Relevant to existing national plans and needs	1	The technology supports the national needs for reducing GHG and pollutant emissions (particularly reducing traffic in GBA), and is aligned with national energy supply security plans.				
High applicability potential	1	The technology does not have barriers with high risks hinder- ing the deployment.				
Technology effectiveness:						
Efficient technology	5	The technology ensures a low consumption of fossil fuel per passenger-kilometer.				
Safe technology	2	The technology ensures safety to passengers as well to main- tenance technicians. Case of accidents must be considered in the safety assessment of the technology.				
Reliable technology	1	The technology is reliable and mature and can be implement- ed without worries.				
Technology cost-effectiveness:						
Low infrastructure investment costs	4	The technology does not require high investment costs for the infrastructure, indispensable for its operation. Examples of in- frastructure are land use for bus corridors, recharging stations for plug-in and electric vehicles, pipelines and compressed gas stations for natural gas vehicles, etc.				
Operating and maintenance cost savings	2	The technology presents significant annual operating and maintenance cost savings comparing to conventional gaso- line powered vehicles.				
Affordable technology	3	The purchase cost of the technology is affordable for passen- gers, if accompanied with taxes and legislative reforms.				
Environmental effectiveness:						
GHG emissions reduction	5	The technology reduces significantly the GHG emissions during vehicle operation. Note that well-to-wheel emissions reductions must be considered for electric and plug-in hybrid vehicles.				
Improvement of air quality	5	The technology reduces significantly the pollutant emissions during vehicle operation. Note that well-to-wheel emissions reductions must be considered for electric and plug-in hybrid vehicles.				
Reduction of hazardous waste	2	The technology does not generate hazardous waste.				
Social benefits:						
Socio-economic benefits	1	The technology presents good impact for socio-economic development and creates job opportunities.				
Short timeframe for applicability	1	The technology does not require too much time for bringing it to a commercially operable status.

5.3 Barrier Analysis and Enabling Framework

5.3.1 Preliminary targets for transport technology transfer and diffusion

Reviewing the existing conditions of the transport sector and the needed mitigation actions, and in order to revitalize the public transport systems and renew existing passenger cars fleet, the preliminary targets are:

- Promote and modernise the bus mass transit system, operable on dedicated lanes in GBA.
- Create a market of hybrid electric vehicles.
- Promote fuel efficient gasoline-powered vehicles.

Beside the preliminary targets, indirect objectives are tackled and do not lack of importance:

- Contribute to a sustainable mobility sector: cleaner environment, efficient, affordable, safe and diversified transport means.
- Enhance Lebanese transport sector brand image.
- Reduce passenger per kilometre transport costs.
- Minimize on the long term the government financial and legislative burdens on the government.

The approach followed in order to set a preliminary programme design for the deployment of the prioritized transport technologies is illustrated and narrated in Fig. 31 and 32.

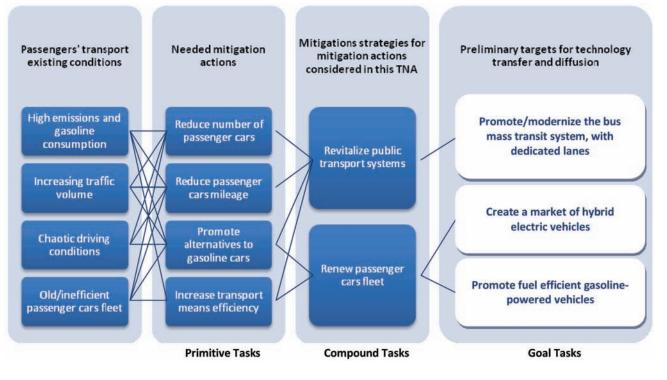

Fig. 31 - Hierarchical process for setting up preliminary targets for transport technologies transfer and diffusion.

	Description	Tools	
Market analysis	 Identification of key stakeholders, market chain actors and the linkage between them. Assessment of the addressable market to use mass transit buses and to swap to hybrid and fuel efficient gasoline vehicles. 	Market mapping	
Barrier analysis	 Identification and classification of barriers to the deployment of the prioritized technologies, including financial, policy, legal, market failures, and institutional analysis. 	 Key stakeholders and expert consultations in order to identify their views and incentives to participate Study of policy papers and case studies 	
Enabling framework	 Identification of measures to the deployment of the prioritized technologies. Set up an enabling framework for the prioritized technologies based on the identified measures. 		
Cost benefit analysis	 Assess the costs and benefits of the required incentives for technology deployment success, from the government and car users' perspective. 	Cost benefit analysis	
Technology action plan and project proposals	 Develop a Technology Action Plan (TAP) outlining the essential elements of the enabling framework, and consisting of a detailed plan of actions to implement the proposed measures and estimate the need for external assistance to cover implementation costs. Develop project proposal for the prioritized technologies for future funding. 	Technology Action Plan	

I

Fig. 32 Approach for developing preliminary programme deployment of the prioritized transport technologies.

5.3.2 Market analysis for deployment of transit bus technologies and passenger car scrappage programme

The first step in the technology deployment approach is carrying out the market chain analysis. It serves two purposes: first, it is a framework for identifying the key stakeholders enabling the deployment process, the market chain actors and the linkage between them; second, it is a practical tool for assessing the addressable market interested in using mass transit buses and/ or swapping to hybrid and fuel efficient vehicles. Market maps for mass transit buses, hybrid electric and fuel efficient gasoline vehicles are presented in annex IV. The identified stakeholders for both programmes: the mass transit system and the scrappage scheme are summarized in Table 31. They are categorized along supply, addressable market and programme enabling entities. Therefore, most of these stakeholders have been included in the consultation meetings held during the barrier analysis and enabling framework process. Table 31 - Stakeholders and market chain actors of mass transit system and passenger cars scrappage programme.

I

Supply	Enabling stakeholders	Addressable market
Bus dealers. Hybrid car dealers. Fuel efficient gasoline car dealers. Association of pre-owned car importers.	Government entities: Ministry of Environment. Ministry of Finance. Ministry of Public Works and transport. Ministry of Interior and Municipalities. Central Bank of Lebanon.	Private passenger car owners. Taxi owners and taxi drivers union. Commercial car owners. Land transport union.
	Non government entities: Commercial banks. International donors.	

5.3.3 Methodology for barrier analysis

Barrier analysis can be understood as mapping out the roots to the real constraints hindering the deployment of the technologies, in order to determine the proper measures. The methodology for the barrier analysis followed in this report is outlined in Fig. 33. Each step was conducted and validated during individual consultation meetings with stakeholders identified in the market mapping technique (refer to Table 31).

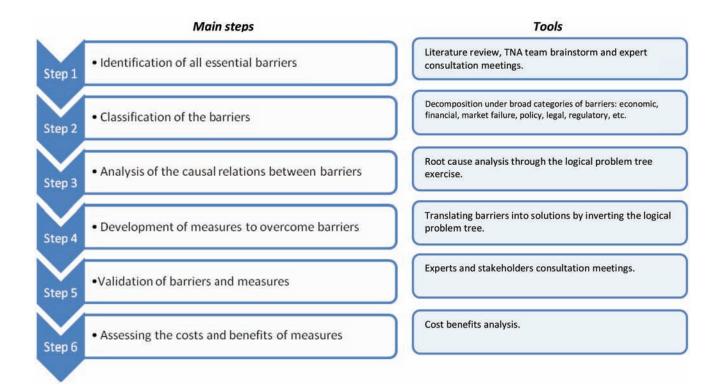

Fig. 33 - Main steps in identifying and analyzing barriers and in developing measures to overcome them.

5.4 Analysis of Technology: Deployment of transit bus technologies on dedicated lanes

5.4.1 General description of transit bus technologies

The prioritized mass transit technologies are diesel buses. The use of natural gas in buses is still at the early pre-design phase in the MoEW due to uncertainties and lack of data on the natural gas supply chain and distribution infrastructure.

Diesel buses are still the most used bus technology worldwide, and the study presented in the TNA under GBA driving conditions showed that diesel bus public transport is a real mean to short-term solution to the environmental pollution issues in GBA, particularly when they are coupled with dedicated lanes and a well designed transport demand management system. They contribute to the different aspects of sustainable developments in GBA mainly (1) improvement of air quality, (2) reduction of GHG emissions, (3) congestion reduction, (4) increase in energy supply security due to reduction of imported oil, (5) social equality and poverty eradication by providing affordable transport with lower operating costs than passenger cars per passenger-kilometer, (6) economic prosperity by reducing travel times and congestion.

5.4.2 Identification of barriers

The barrier analysis work was carried out through a root-cause analysis presented in annex IV, summarized by a logical problem tree.

Main conclusions from the analysis are as follow:

- The starter problem of not having collective transport is the current poor market infrastructure for mass transit bus systems.
- The main barriers are:
 - The poor demand due to the mismanagement of the existing old and unmaintained fleet, the poor bus network and the long travel time.
 - The underdeveloped supply due to limited capacity of relevant institutions and insufficient number of specialized experts, particularly at the MoPWT.

- The well-established alternatives to mass transit due to the lack of regulatory framework, from which the government is reaping benefits through tax revenues levied on fuel import and on car purchase and road usage.
- The root cause to all barriers is the absence of transport policy at the national level, providing a coherent transport demand management strategy. This lack of national policy is mainly due to having a government clash of interests and therefore limited willingness to invest.

The main economic and financial barriers are the high implementation costs of a mass transit bus systems operating on dedicated lanes, along with the inappropriate financial incentives allocated to passenger car users through loan banking facilities and easy access to pre-owned imported cars. Decomposition of barriers is summarized in Table 32.

The main non financial barriers consist of the lack of institutional capacity for planning and operation management, the absence of regulatory framework to favor mass transit buses. Decomposition of barriers is outlined in Table 33.

Economic and fir	Economic and financial barriers					
High purchase cost of bus technologies	Inadequate government policies on purchase cost.	 High customs and excise fees (Custom and excise fees are applied similar to passenger cars). 10% VAT on car value and duty. For public transportation cars, car registration fees are 2% of the vehicle's estimated value. 				
High implementation cost	Transit bus systems need to be operated on dedicated lanes, which reduce parking areas.	 Additional costs must be considered for lanes reservation and building parking towers. 				
Inappropriate financial incentives and disincentives	Favorable treatment for conventional pre-owned gasoline vehicles.	 Banking loan facilities to buy pre-owned vehicles. Large scale of pre-owned car import. Inappropriate road-usage fees on pre-owned and brand new cars. 				
	Non-consideration of negative externalities in pricing transportation means using conventional gasoline vehicles.	 High urban pollution and GHG emissions due to excessive use of gasoline in old and inefficient passenger cars fleet. Long travel time wasted due to chaotic traffic conditions in GBA. 				
	Tax on maintenance and repair imported spare parts.	Custom and excise fees.10% VAT.				
Fiscal burden on the public treasury	The current arrangement for provision of Public Transport service is fiscally unsustainable.	 The Railway and Public Transport Authority (RPTA), which maintains minimal service, requires a subsidy of USD 8.7 million per year, over twice the amount it earns from fare revenues to remain viable (in 2007). The government subsidizes the social security obligations of the 33,000 red-plate holders estimated to be about USD 32.4 million per year (in 2007). 				

Table 32 - Decomposition of financial barriers to deployment of mass transit bus systems.

Table 33 - Decomposition of non-financial barriers to deployment of mass transit bus systems.

L

Market imperfe	ction	
Poor market infrastructure for transit bus systems	Poor passengers demand for transit bus systems.	 Poor bus network with low frequencies (Current bus systems do not serve all boroughs, even within GBA). Long travel time since no reserved lanes are allocated to bus. Old and unmaintained bus fleet.
	Under-developed supply channels of transit bus system (Lack of a coherent, reliable and efficient mass transit system).	 Insufficient number of transit buses (currently no buses owned by the government are running). No bus-stop stations. The actual mass transit system lacks coherent organization, therefore, it does not comply with the mobility requirements and needs. There is improper distribution of the existing public transport supply over the market. The main cities (Beirut and Tripoli) are overserved and witness severe competition among operators while other Lebanese regions suffer from a shortage of mass transit service providers. No capability to compete with private operators of buses and minibuses which are not subject to stringent regulations, under the current institutional capacity of relevant authorities.
	Mismanaged public transport sector.	 Irregularities in bus operation, with no real-time information on the bus operation status. Low passengers acceptance due to cleanliness and safety issues. Poor information on existing bus tracks and network.
Market control by incumbents	Well-established alternatives to public transit systems.	 Easy access to own and use private passenger cars. Oversupply of red plates in the marketplace: the quotas on the number of shared taxis and minibuses have not been set in relation to market demands. Uncontrolled and unorganized shared and private taxis sector (50,000 are on the market, 17,000 are illegal, operate mostly in GBA). Private bus operators are more competitive than public operator.
Policy, legal and	d regulatory	
Insufficient legal and regulatory	Legislation favor incumbent transport means.	 No/insufficient regulations to specify the operation maneuvers of private bus operators and taxi owners.
framework	Lack of implementation of legislation governing buses emissions.	• No regulation or legislation on fuel efficiency and emission standards of imported pre-owned cars (such as decree 6603/1995 relating to standards for operating diesel trucks and buses, monitoring and permissible levels of exhaust fumes and exhaust quality).
Clash of interests	Deployment of transit bus systems go against the perceived interest of the government.	 Deploying transit bus might deprive the government from some revenues: Tax revenues from customs on car purchase. Revenues from VAT. Revenues from registration. Revenues from road-usage fees. Tax revenues levied on consumed gasoline.
No enforcement to deploy	Missing/insufficient executive and regulatory bodies.	 Insufficient number of employees in relevant authorities to mass transit systems (particularly MoPWT).
transit bus systems	Insufficient willingness to enforce laws and regulations.	

Institutional and	d organizational capacity	
Limited institutional capacity	Limited capacity to promote and enhance market of transit bus systems.	Limited number of employees at MoPWT, DGLMT and RPTA
	Limited number of service and maintenance specialists.	Insufficient number of qualified bus drivers and technicians for maintenance and damage repair
	Need for specialized bodies and experts in relevant ministries and institutions at transportation planning level and operational level.	
	Fragmentation of responsibility among concerned government agencies; gap in the transport system management function with overlapping jurisdiction.	 Several institutional actors deal with the field of Passenger Transportation. Each one is in a way in charge of the organization of the transport system and its functions and decisions influence the whole public transport system. These actors are: Directorate General of Land and Maritime Transport (DGLMT) Directorate General of Roads and Buildings which is within the MoPWT and responsible for the construction, rehabilitation and maintenance of public roads and government buildings. Ministry of Interior and Municipalities which is in charge of vehicle registration and inspection, driver's licensing and traffic code implementation. RPTA which is in charge of public transport operations. Municipalities which are in charge of roads within municipal jurisdiction, and associated regulation of transport and traffic.
		ise among Traffic Management Organization (TMO) staff, inhibiting it from nanagement mandates it was conceived for.
Human skills		
Insufficient personnel for preparing projects	Insufficient number of sp levels.	pecialized experts in relevant ministries at planning and operational
Social, cultural	and behavioral	
Consumer preferences and social	Lack of confidence in public transport.	Mismanaged sector.
biases	Passengers prefer the easy way of using their private passenger cars.	Passenger cars present the ultimate mean for freedom of mobility since there are no parking or access restrictions in GBA.
Information and	awareness	
Lack of information	No dissemination of information on ecological and economical benefits of transit bus systems.	• No extensive efforts are needed on this point since the current traffic and economic situation in GBA serve as driving force to push travelers toward mass transit means.

5.4.3 Identification of measures

The range of measures for the deployment of a bus mass transit system in GBA, operating on dedicated lanes are presented in Table 34 and Table 35. Financial measures consists mainly of facilitating the government investments in mass transit buses. On the other side, financial disincentives cannot be imposed on other modes of transport in order to penalize them (except the road-usage fees applied to passenger cars); however, additional efforts should be made to improve the quality of service of bus mass transit systems, in order to provide a quality of service that approximates that which car drivers have been used to. As a result, dedicated lanes, wide coverage to all boroughs, real-time information, uninterrupted operation, are inevitable services.

Financial measures cannot guarantee alone the success of deployment of mass transit system. They should go along with non financial measures, summarized in Table 35. They consist mainly on deploying effective measures for improving the operation management and the infrastructure, in addition to setting up a regulatory framework that clearly manages the operation maneuvers of public bus operators, private bus operators and taxi owners.

Table 34 - Financial measures to deploy a bus mass transit system on dedicated lanes in GBA.

Economic an	Economic and financial measures					
Appropriate financial incentives	Favorable treatment for mass transit buses rather than conventional pre- owned gasoline vehicles.	 Exempt mass transit buses from custom and excise fees. Exempt from the registration fees (2% of the estimated car price).Exempt spare parts from custom and excise fees, particularly catalytic converters and filters. Allocate concessionary fares to older people, students and disabled persons. Use smart card ticketing schemes allowing travelling on all mass transit buses in GBA with one flexible ticket, available on daily, weekly, monthly, or yearly basis (Long term subscriptions bring additional savings to travelers). 				
	Encourage taxi and shared taxi owners to work in the bus mass transit system.	• Give special incentives to taxi drivers to get involved in the bus mass transit system in order to limit the number of illegal taxis (17,000 taxis) and reduce the extensive number of taxis (33,000 taxis).				

Table 35 - Non financial measures to deployment of bus mass transit system on dedicated lanes in GBA.

L

Market development	-	
Develop market infrastructure	Stimulate passengers demand to use mass transit buses.	 Design of a complete bus network (bus tracks and bus stop locations) covering all boroughs within GBA
	Deploy effective infrastructure measures like an optimized land use planning.	• Reserve lanes within GBA for bus operation (reserved lanes are expected to substitute the parking spaces on both sides of the main avenues; therefore, parking spots must be constructed and managed by municipalities)
	Deploy effective operation measures like optimizing the operation management of the bus mass transit system (The objective is to provide a quality of service that approximates that which car drivers have been used to, in order to maintain a high level of mobility access in GBA with a drop in overall car usage).	 Conserve a clear and regular bus operation Implement a real-time information system, tracking the bus operation and displaying the waiting time (information to be displayed on screens in bus stations, on mobile smartphones through special applications and on dedicated websites) Deploy personalized travel planning tools in order to optimize and predict the travel time Implement intelligent transport technologies like the transit signal priority in order to reduce the bus stop times on red lights Set up stringent maintenance and cleanliness programme.
	Develop the supply channels of bus mass transit system.	 Purchase sufficient number of transit buses with the proper powertrain technology, in order to cover the designed network and avoid irregularities in operation Construct bus stations taking into consideration the physical access to buses and stations (for example: improvements to pavements, access ramps for people with limited accessibility, timetables which can be read by those with visual impairment) Construct relevant maintenance and repair workshops.
Manage the transport demand rather than being controlled by incumbents	Deploy a combination of access, personal travel planning and parking spots to lock the benefits from the aimed operational and infrastructural measures	
Technological development	Encourage and rely on R&D institutions in order to adopt knowledge-intensive high-tech management approaches for solving complex urban transport problems.	 Follow up on environmental and economical benefits, and to test advancement in new technologies Favor R&D to create local spare parts manufacturer.

Policy, legal and regulatory			
Set up a regulatory framework for mass transit sector	Legislation favor mass transit transport means in general and public bus transit in particular.	•	Set clear regulations specifying the operation maneuvers of private bus operations and taxi owners (such regulations must be preceded by setting up a national policy for the global mass transit sector, including the role of each of the private and public operators and the taxi owners).
	Enforce the deployment of bus transit systems.	•	Create/enhance executive and regulatory bodies in charge of ensuring the design, deployment and follow up of the regulatory framework. Restructure, empower and enhance the role of the traffic management organization (TMO).
	Implement legislation governing buses emissions.	•	Update and implement decree 6603/1995 relating to standards for operating diesel trucks and buses, monitoring and permissible levels of exhaust fumes and exhaust quality Enforce the bus inspection programme requirements and mandating the presence of catalytic converters.
	Enforce legislative reforms in urban planning laws, expropriation laws (if needed in some areas), and traffic laws.	•	Redefine the use of urban road infrastructure, taking into consideration the total/partial exclusive use of lanes in mass transit buses. Encourage municipalities to build parking spots to optimize the urban road space and allow reservation of lanes for mass transit buses. Adopt a transit signal priority on red lights in order to reduce the bus travel time.
Institutional and organization	nal capacity		
Develop institutional capacity	Enhance bus transit services.	•	Recruit and train bus drivers on eco- driving attitude and safety principles. Recruit and train specialized maintenance technicians. Recruit and train management and control staff in charge of managing and optimizing the planning and bus operation.
	Clarify and centralize responsibility among concerned government agencies in order to tackle the gap in the transport system management function.		
	Restructure, empower and enhance the role of the Traffic Management Organization (TMO).	•	Develop technical expertise among TMO staff, in order to carry out the traffic management mandates it was conceived for.

L

Social awareness

Dissemination of information

Aware travelers on ecological and economical benefits of transit bus systems.

 Provide information on CO₂ and fuel savings comparing to passenger cars, through the proper info display tools: mobile applications, dedicated website, media campaigns, etc.

5.4.4 Action Plan for deployment of transit bus technologies on dedicated lanes

Target for technology transfer and diffusion

The objective of the TNA for deploying mass transit buses is to highlight the benefits of bus transit system on dedicated lanes in GBA in terms of fuel savings and emissions reduction. The assessment is carried out per bus unit, and results show considerable savings. Therefore, the focus is to identify the proper strategy to revitalize the public transport and the most efficient bus technologies under the current driving conditions in GBA. Specifying the number of buses and design of the mass transit road networks need an engineering assessment study and was left for further steps with relevant authorities.

However, according to studies carried out by the MoPWT on public transport revitalization relying on bus transit, it is estimated that 507 buses will be needed in GBA, 85 in Tripoli, and 45 to serve intercity; a total of 637 buses countrywide. The total non-recurring investment in vehicles, infrastructure, terminals, depots, etc., is estimated at USD 400 million. Such revitalization target could be implemented on a 5 year basis. It is recommended that urban buses be operated on natural gas for a better air quality; however, this plan is mainly affected by the security of supply of natural gas to Lebanon, and a comprehensive feasibility study needs to be carried out to assess this option. The Technology Action Plan for transit bus technologies operating on diesel and on dedicated lanes is presented in Table 36.

Table 36 - Technology Action Plan for transit bus technologies on dedicated lanes

Measures	Priority	Objectives	Responsibilities	Time scale	Monitoring & Evaluation indicators	Estimated cost (USD)
Design a complete bus network covering all boroughs within GBA and reserve lanes for bus operation	1	Shift travel demand to efficient transport means: bus transit system.	Municipalities OCFTC DGRB CDR	Short term	Bus network on reserved lanes in GBA.	500,000 (design study of the network).
Ensure sufficient number of transit buses with the proper powertrain technology	1	Cover the designed network with sufficient number of buses and avoid irregularities in operation	MoPWT	Short term	Purchase of the required buses.	0
Exempt mass transit buses (and their spare parts) from custom and excise fees, and from registration fees	1	Decrease the cost incurred for the government on the import of the mass transit buses and give appropriate financial incentives for mass transit buses.	MoF	Short term	Law on fee exemption enacted by the government.	N/A
Create an employee package for taxi drivers (including social benefits, insurance, retirement plans, etc.)	1	 Encourage taxi and shared taxi owners to work in the bus mass transit system Limit the number of illegal taxis (17,000 taxis) and reduce the extensive number of taxis (33,000 taxis) 	MoPWT OCFTC MoF	Short/ Medium term	Package for bus drivers.	1,000 (legal services to create a package).

Measures	Priority	Objectives	Responsibilities	Time scale	Monitoring & Evaluation indicators	Estimated cost (USD)
Develop technical expertise among TMO staff and high level management	5	 Carry out the traffic management mandates it was conceived for. Enhance the role of the Traffic Management Organization (TMO). 	MoPWT	Medium term	Well-trained TMO staff.	8,000 (technical training of 15 employees).
Provide information on CO ₂ , fuel and cost savings comparing to passenger cars	6	 Increase awareness of travelers on ecological and economical benefits of transit bus systems. Shift travel demand to efficient transport means: bus transit system. 	MoPWT	Short/ Medium term	info display tools on CO ₂ and fuel savings: mobile. applications, dedicated website, media campaigns, etc.	50,000 (full awareness campaign).

5.5 Analysis of Technology: deployment of hybrid and fuel efficient gasolinepowered vehicles through a scrappage programme

5.5.1 General description of hybrid electric vehicles and fuel efficient gasoline-powered vehicles

Fuel efficient gasoline powered vehicles

Fuel efficient vehicles are conventional gasoline powered vehicles with low consumption, equipped with advanced technologies, reduced vehicle weight, downsized engine, idle stop/start systems and continuous variable transmissions.

Considerable consumption and CO_2 emissions savings are observed with fuel efficient vehicles from 10% to 50% comparing to the world average new cars fleet of 2005, and from 35% to 64% comparing to the Lebanese average consumption of the passenger cars fleet in 2007 under GBA driving conditions. Therefore, all these vehicle segments must be promoted through proper incentives and adequate tax policies, to substitute the current Lebanese trend of buying large inefficient cars.

Hybrid electric vehicles

Hybrid electric vehicles (HEV) combine an electric motor and battery pack to the internal combustion engine (ICE) found in conventional vehicles. They are characterised by low consumption, high driving range, reduced emissions and downsized engine. Hybrid vehicles present 40% to 53% fuel and CO_2 savings compared to small to midsize cars.

5.5.2 Identification of barriers

Barriers for deployment of fuel efficient gasoline cars are few and a fuel efficient car market is already established. However, these cars need additional measures are needed to favor their deployment over the imported pre-owned vehicles that are flooding the market.

As for hybrid cars, the market is still inexistent due to the following main barriers:

• The low demand for hybrid vehicles due to the high purchase cost of these cars, the lack

of consumer or market incentives and the wrong perception of consumers regarding hybrid cars' performance.

- The high demand for pre-owned non efficient gasoline vehicles due to the low cost of these cars, the banking loan facilities, and the current inappropriate road-usage fees.
- The root cause to all barriers is similar to that for deploying mass transit buses: the inadequate current transport policy and the lack of national policy providing a coherent transport demand management strategy. Once again, this lack of national policy is mainly due to having a government clash of interests and therefore limited willingness to invest.

The main economic and financial barrier is the inappropriate financial incentives and disincentives, through a favorable treatment to conventional preowned gasoline vehicles, faced by lack of any incentive for fuel efficient and hybrid technologies. Decomposition of barriers for hybrid and fuel efficient vehicles is summarized respectively in Table 37.

The main root cause of non-financial barrier is the loss of revenues for the government from taxes related to the import of gasoline and gasoline vehicles. In fact, the government collects revenues from taxes levied on imported gasoline and car purchase, in addition to road-usage fees proportional to engine displacement. Moreover, private companies import the gasoline for transportation; therefore, the government does not have any interest in reducing the imported quantity, unless the assessment of the impact of the external costs resulting from the excessive dependence on gasoline (health concerns, emissions and pollution impact, etc.) is internalized. Decomposition of barriers is outlined in Table 38.

Table 37- Decomposition of financial barriers to deployment of hybrid and fuel efficient vehicles.

Economic and financial b	parriers	
High purchase cost particularly of hybrid vehicles	Inadequate government policies on purchase cost (MoF, 2011)	 High customs and excise fees. Inadequate registration fees. Inadequate road-usage fees. 10% VAT on car's estimated value plus duty.
Financially not viable to some dwellers.	Low affordability amongst part of rural and peri-rural dwellers	• Low income (CAS, 2011).
Inappropriate financial incentives and disincentives to both hybrid and fuel efficient vehicles	Favorable treatment to conventional pre-owned gasoline vehicles	 Banking facilities to buy pre-owned vehicles Large scale of pre-owned car import dating up to 8 years old. Inappropriate road-usage fees on pre-owned and brand new cars.
	No market incentives to deploy hybrid and fuel efficient vehicles	High customs and excise fees.10% VAT on car's estimated value plus duty.
	No consumer incentives to buy hybrid and fuel efficient vehicles	 Inadequate registration fees. Inadequate road-usage fees at registration. High insurance fees. Must pay loan interest.
	Non-consideration for externalities in pricing transportation means using conventional gasoline vehicles	 High urban pollution and GHG emissions due to excessive use of gasoline in old and inefficient passenger cars fleet. Long travel time wasted due to chaotic traffic conditions in GBA.

Table 38 - Decomposition of non financial barriers to deployment of hybrid and fuel efficient vehicles.

L

Market failure/imperfec	tion				
No hybrid vehicles market	Poor demand for hybrid.	 High purchase and ownership costs. No market incentives. No consumer incentives. Low consumer acceptance (resistance to change). 			
Underdeveloped competition	Insufficient number of hybrid vehicle suppliers	• HEV suppliers have no incentives or will to invest before any law is ratified exempting these cars from excise and custom taxes (Bejjani, 2012; Younis, 2012).			
Lack of reference projects in Lebanon	The recent extensive use of sub-compact fuel efficient cars by private companies has led to promoting them, due to the positive feedback on the tangible fuel consumption savings. No such experience is available for hybrid vehicles				
Policy, legal and regula	tory				
Insufficient legal and regulatory framework	Legislation favor conventional gasoline vehicles	 Lack of stringent fuel-efficiency and carbon standards on imported pre-owned and new gasoline vehicles. Lack of implementation of legislation governing vehicle emissions (such as Decree 6603/1995). Lack/corrupted safety control bodies on pre-owned imported cars when entering the country. 			
	Lack of coherent tax policies	• Higher road-usage fees on new cars which have low emission levels v/s lower road-usage fees on pre-owned old imported vehicles with unknown/high emission levels (MoF, 2011) (For example, a new 10 horsepower efficient car pays USD 216 road-usage fees, and a 50 horsepower car made before 1997 pays USD 153, 30% less).			
	Hybrid and fuel efficient cars deployment goes against the perceived interest of the government	 Deploying HEV and fuel efficient cars might deprive the government from some revenues: Tax revenues from customs on car purchase. Revenues from VAT, consumed gasoline, registration and from road-usage fees. 			
Network failures					
Weak connectivity between actors favoring HEV and fuel efficient cars deployment	Insufficient coordination between relevant ministries and HEV suppliers. No cooperation between relevant ministries and R&D institutions.				
Incumbent networks of pre-owned car importers are favored	No regulation or legislation on fuel efficiency and emission standards of imported pre- owned cars.				
Lack of involvement of stakeholders in decision-making regarding transport policies	Stakeholders' consultation culture missing.				

Institutional and organiz	zational capacity				
Lack of professional institutions	 Need for specialized bodies in relevant ministries at transportation planning level and operational level. Lack of/inefficient regulatory body in the transport sector. Lack of institutions to support technical standards for transportation. 				
Limited institutional capacity	No R&D culture in transportation.	 R&D facilities are missing. Lack of appreciation of R&D role in mitigating transport technologies. 			
Human skills					
Lack of service and maintenance specialists	Low availability of qualified technicians for HEV maintenance and damage repair except at car dealers.				
Inadequate personnel for preparing projects	Limited number of specialized e	xperts in relevant ministries.			
Social, cultural and beh	avioral				
Tradition and habits	Resistance to change due to un	familiarization and wrong perception of new technologies.			
Lack of confidence in HEV	Unknown product due to inadequate information on HEV performance.				
Information and awaren	IESS				
Inadequate information	No dissemination of information economical benefits, etc.	to consumers on HEV performance, environmental and			
Technical					
Inadequate	Lack of initiatives to set standard	ds on vehicle emissions and fuel efficiency.			
standards, codes and certification	Standards not obligatory.				
	Lack of facilities for testing vehic	cles and certification.			
Data and information					
Lack of mobility monitoring data	Limited monitoring data to support transport studies aiming at the development of sustainable transportation strategies.	 Lack of Mobility Monitoring Indicators (MMI) framework, which serve as the basic step in setting a national sustainable mobility strategy The Central Administration of Statistics (CAS) publishes very basic information on transport sector status. Transport studies carried out by ministries and relevant authorities are not shared, neither the results nor even the information on the content (as a result, work is duplicated without reaching to a national transport strategy set up). 			

L

5.5.3 Identification of measures

Creating conditions for deploying green transport alternatives in general and hybrid and fuel efficient vehicles in particular requires governmentmandated regulatory measures together with incentives that motivate a shift in behavior. Based on the analysis of current barriers facing that deployment, the following measures are suggested so that conditions favorable to efficient transport can be cultivated.

The range of financial measures presented in Tables 39 and 40 are intended to enable the creation of a hybrid vehicle market and to favor sales of fuel efficient vehicles, to encourage both sides of the market chain: the car suppliers to invest, and the consumer to swap old cars with hybrid or a fuel efficient car. Concurrently, disincentives should be introduced to limit the market of non-efficient and pre-owned imported vehicles. Therefore, a balance must be created through proper allocation of purchase taxes and/or road-usage fees, based on a stringent fuel-efficiency and emission standards on pre-owned vehicles, instead of allowing fees based on engine horsepower and the model year.

the French **Bonus-Malus** An example is programme applied since 2007 to new vehicle purchase. The registration or purchase tax is a oneoff tax levied on vehicles related to the CO₂ rate of emission, according to a differentiated energy class system currently consisting of seven emission classes. Vehicle emitting more than 150 g/km are subject to malus and those lower than 110 g/km receives a bonus subsidy from the government (ADEME,2011). Moreoveranannual Malusof USD 205 (160 Euros) is owed by owners of vehicles emitting more than 245 g/km. Bonus-Malus scheme and programme outcomes are summarized in Fig. 34 and Fig. 35, showing the success of the programme has succeeded in favoring the sale of fuel efficient cars, reaching 56% in 2009 for the bonus classes.

Financial measures must go along with non financial actions mainly in issuing the requested legislations and setting the regulatory framework for implementing the incentives and making the relevant tax reform. Moreover, information dissemination to consumers during car purchase on consumption, emissions and money savings is of high importance in order to cope with the resistance to change of consumers and the wrong perception on hybrid car performance.

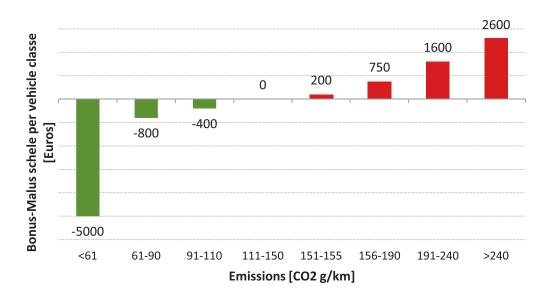

Fig. 34 - Bonus-Malus on car sales per emissions class (a negative value is a bonus).

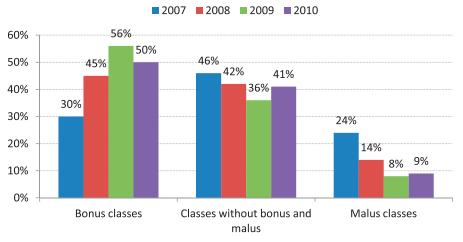

Fig. 35 - Structure of car sales according to the bonus-malus scheme.

Table 39 - Financial measures for the creation of hybrid vehicle market and favoring sale of fuel efficient vehicles.

Economic and	financial measures	
Government incentives to reduce vehicle purchase and ownership	Market incentives	 Exemption from customs and excise fees on vehicles to favor hybrid and fuel efficient car suppliers invest. Exemption from custom and excise fees on non conventional hybrid spare parts (battery, electric motor, etc.) in order to favor spare parts suppliers invest.
costs	Consumer incentives	 Exemption from registration fees. Exemption from road-usage fee at registration. Payment of minimum salvage value (ex. USD 2,500) as down payment for car loan. Extension of loan period to 8 years particularly for hybrid car purchase. Reduce loan interest and/or full subsidy of loan interests for heavy mileage drivers like taxi owners.
	Technicians incentives	• Help domestic maintenance and repair technicians to buy equipments through banking facilities (kafalat programme).
Government disincentives to import of non efficient pre-owned vehicles	Set up coherent tax policies disadvantaging the demand for high fuel consuming pre- owned vehicles	 Reduce gradually maximum age of imported pre-owned vehicles to 3 years with a mileage lower than 100,000 km, rather than 8 years as the current figure. Road-usage fees must be reconsidered according to fuel efficiency and/or emissions rather than engine displacement as the current figure: Increase gradually road-usage fees on old high consuming vehicles, already owned by consumers. Increase road-usage and registration fees on imported pre-owned high consuming vehicles. Reduce road-usage and registration fees on new and pre-owned low consuming vehicles. Increase road-usage fees on the second owned car, for private use.
	Set up stringent fuel-efficiency and emissions standards on pre-owned imported vehicles	• Fuel-efficiency and emissions standards are intended to help setting adequate tax policies (<i>Bonus-Malus: polluters pay more taxes</i>), in order to favor low consuming new and pre-owned vehicle rather than high consuming pre-owned vehicles.

Table 40 - Non-financial measures for the creation of hybrid vehicle market and favoring sale of fuel efficient vehicles.

I

Market develop	ment	
Implement a vehicle retirement programme with incentives	Create a car termination plant	• Create a plant that deals with the car termination process after the swap in the scrappage programme (interested customers in swap shall not have a grant salvage value for their old car or any incentive unless they got the certificate of car termination from the MoE or other special entity in charge). Car termination process is one of the success key of the scrappage programme; therefore, old car termination options should be clearly stated and formulated.
Policy, legal and	d regulatory	
Set up legal and regulatory framework to create HEV market and promote fuel efficient vehicles	Issuance of law exempting these cars from customs, registration and road-usage fees at registration in order to amend vehicle taxation system into a more balanced environmentally oriented scheme	 Exemption of new HEV from customs and excise fees, and from registration and road-usage fees at registration. Exemption/reduction of new fuel efficient vehicles from custom and excise fees. Payment of minimum salvage value (ex. USD 2,500) as down payment for hybrid vehicle loan. Exemption of salvage old cars from unpaid road-usage fees in order to encourage their owners to swap their old cars (as in the law, these owners cannot sell their cars if they do not pay all due road-usage fees). Full subsidy of loan interests over loan period for taxi drivers, students and disabled persons swapping for hybrid cars.
	Implement legislation governing vehicle emissions	 Update and implement decree like that of 6603/1995 relating to standards on permissible levels of exhaust fumes and exhaust quality. Enforce/update the vehicle inspection programme requirements taking into consideration the special requirements for hybrid cars' inspection, in addition to mandating the presence of catalytic converters on conventional gasoline vehicles.
Set up new coherent tax policies	Issuance of law modifying the current tax figure in order to cope with the high demand for high fuel consuming pre- owned vehicles	Adopt a Bonus-Malus tax policy where polluters pay more annual road-usage fees.
Institutional and	d organizational capaci	ty
Create professional institutions	Create institutions to support technical standards for transportation	• Set up a mechanical inspection unit at the port of Beirut in charge of checking up the emissions and safety standards of imported pre- owned cars before entering the country.
Promote technological development	Promote R&D culture in transportation in order to adopt knowledge- intensive high- tech management approaches for solving complex urban transport problems in GBA	 Encourage local industry to develop and manufacture spare parts Give incentive to R&D institutions which play an essential role in mitigating transport technologies Encourage universities to create engineering mobility programmes.

Social awarene	SS	
Awareness campaign to promote hybrid and fuel efficient cars	Dissemination of information to consumers on these cars' performance, environmental and economical benefits	 Enforce new car dealers to include factsheets on all vehicles, clearly displaying information on vehicle average fuel consumption and annual fuel costs, in addition to average CO₂ emissions. Enforce marketing campaign (billboards, TV, etc.) to include the mentioned above consumption and emissions labeling of the car. Enforce all government vehicles to switch to HEV when buying new cars, in order to take the lead as a reference project.
	Dissemination of information to particular consumers which have high annual mileage like taxi drivers and commercial vehicle users	 Present additional financial incentives like the full subsidy of loan interests over the loan period.
Data and inform	nation	
Set up a mobility monitoring organism (with an easy and free access to data, particularly for R&D institutions)	Create Mobility Monitoring Indicators (MMI) framework to support transport studies aiming at the development of sustainable transportation strategies	 Delegate the CAS with additional experienced personnel and authority to provide on yearly basis the complete MMI set. Enforce cooperation and communication on transport studies between relevant authorities resource savings.

5.5.4. Action Plan for deployment of hybrid and fuel efficient gasoline-powered vehicles through a scrappage programme

Target for technology transfer and diffusion

The aim from promoting and deploying hybrid and fuel efficient vehicles is not introducing additional passenger cars to the fleet (1.5 million cars are officially registered in 2010) but replacing non efficient vehicles. Therefore, the target consists of developing and implementing a complementary, integrated car scrappage programme aiming at reducing emissions from the existing fleet, where old, illegal, highly emitting, non fuel efficient vehicles would be bought by the Government and scrapped. In return, owners of scrapped cars are allocated an incentive to buy a new hybrid or fuel efficient car. Incentives can have various forms, such as custom and excise exemption, exemption from registration and road usage fees, payment of minimum salvage value (ex. USD 2,500) as down payment for new car loan, reduce loan interest and/or full subsidy of loan interests for heavy mileage drivers like taxi owners.

Such programme pursues a range of social and economic goals in addition to reducing emissions, such as preventing vehicle abandonment, lowering consumer spending on gasoline, and stimulating new vehicle sales. As a result, the vehicle turnover rate increases by incentivizing vehicle retirement.

The implementation of a car scrappage programme in Lebanon is a top priority measure that needs to be undertaken in parallel to implementing a bus mass transit system on dedicated lanes. However, car scrappage can have various forms of incentivebased applications. For heavy mileage drivers like taxi owners, where swapping to hybrid or fuel efficient vehicles have a high impact on enhancing air quality and reducing emissions, maximum incentives should be allocated. The estimated size of the taxi drivers interested by a car swap under scrappage programme is around 12,000 over 8 years, with driver age lower than 55 and car model year older than 2007. However, for private passenger car owners, estimated size depends largely on the incentives to be allocated: a well-defined programme could target a car fleet renewal between 8% and 10% by 2020.

Strict control needs to be exerted simultaneously in order to enforce the ban on old cars and therefore prevent the illegal import of such old cars that need scrapping. In parallel, strict emission standards need to be defined and enforced, in addition to amending the vehicle taxation system and registration fees into a more balanced environmentally oriented scheme. A comprehensive feasibility study needs to be carried out to assess and well-define such programme.

The technology Action plan for the deployment of hybrid and fuel efficient gasoline-powered vehicles through a scrappage programme is presented in Table 41.

Measures	Priority	Objectives	Responsible parties	Time scale	Monitoring & Evaluation indicators	Estimated cost (USD)
Exemption from customs and excise fees, exemption from registration fees, exemption from road- usage fee at registration	1	- Create appropriate financial incentives for hybrid and fuel efficient cars. purchase - Reduce car purchase and ownership costs.	MoF	Short term	Law on tax exemption by government.	0
Payment of minimum salvage value (ex. USD 2,500) as down payment for car loan, extension of loan period to 8 years, reduce loan interest	1		MoF BDL. Commercial Banks	Short term	Car loan package and facilities for hybrid and fuel efficient cars.	2,500 per car
Reduce gradually maximum age of imported pre-owned vehicles to 3 years with a mileage lower than 100,000 km, rather than 8 years as the current figure	1	- Create disincentives for import of non efficient pre- owned cars - Limit the import of pre-owned non fuel efficient vehicles.	MoM	Short/ Medium term	Law on import of pre-owned cars.	0
Adopt a Bonus-Malus tax policy where polluters pay more annual road-usage fees, and where taxes like the road usage fees are reconsidered according to fuel efficiency and/ or emissions rather than engine displacement as the current figure	2	Set up new coherent tax policies to cope with the high demand for high fuel consuming pre-owned vehicles.	MoF	Short term	Bonus-Malus tax scheme.	10,000 (for the preparation of the bonus- malus draft policy)

Table 41 - Technology Action plan for hybrid and fuel efficient gasoline-powered vehicles through a scrappage programme

Measures	Priority	Objectives	Responsible parties	Time scale	Monitoring & Evaluation indicators	Estimated cost (USD)
Create a car scrappage programme based on swapping current passenger cars with hybrid and fuel efficient cars	2	Renew the passenger car fleet Enhance the efficiency of the passenger car fleet.	MoF New cars dealers	Short term	Car scrappage program.	30,000
Create a car termination plant that deals with the car termination process after the swap in the scrappage programme	3	Implement a vehicle retirement programme to remove old cars from the fleet.	MoPWT MoIM MoE	Short/ Medium term	Car termination plant.	-
Update decree 6603/1995 relating to standards on permissible levels of exhaust fumes and exhaust quality to cover all types of vehicles	4	Improve air quality as transport sector is the main air polluter.	MoE	Short/ Medium term	Updated law 6603/1995.	0
Update the vehicle inspection programme requirements taking into consideration special requirements for hybrid cars' inspection, in addition to mandating the presence of catalytic converters on conventional gasoline vehicles	4	Improve the vehicle inspection programme.	MoE MoIM	Short/ Medium term	Updated vehicle inspection programme.	50 per trained person
Set up a mechanical inspection unit at the port of Beirut in charge of checking up the emissions and safety standards of imported pre-owned cars before entering the country	5	- Create institutions to support technical standards for transportation - Limit the import of deficient and crashed pre- owned cars.	MoPWT MoE	Short/ Medium term	Mechanical inspection unit at the port of Beirut.	-
Establish awareness campaign	6	Promote hybrid and fuel efficient cars.	MoPWT MoE	Short/ Medium term	Awareness campaign.	50,000 (full awareness campaign)
Create Mobility Monitoring Indicators (MMI) framework	7	Develop sustainable transportation strategies.	MoPWT MoE CAS	Short/ Medium term	Mobility monitoring indicator framework delegated to CAS.	0

5.6 Enabling framework for overcoming the barriers in transport sector

Fully eradicating the problems of the Lebanese transport sector in GBA is neither affordable, nor economically feasible. However, much can be done to reduce and to lessen the burden of their negative impacts on travelers and the public treasury. Hence, effectively managing this sector requires both a holistic and integrated strategy that goes beyond the visible incidence of these problems and extends to setting a national transport policy, managing all transport services as a whole.

This project has served to highlight the barriers and measures of mass transit buses, hybrid vehicles and fuel efficient gasoline vehicles: technologies highly prioritized by transport experts and stakeholders. While there are many possible measures that can be deployed, there is no single perfect solution. The following Tables propose an enabling framework for a set of measures, presented at two levels. The first level addresses the common barriers of the prioritized technologies, and the second level is technology-specific.

Table 42 provides a summary of the common measures for deploying prioritized technologies.

Economic and financial measures	Policy, legal and regulatory	Institutional and organizational capacity	Social awareness	Data and information
Amend vehicle taxation system and registration fees into a more balanced environmentally oriented scheme: • Exempt mass transit buses and hybrid vehicles from custom and excise fees, registration fees registration fees parts from custom and excise fees, parts from custom and excise fees, particularly catalytic converters and filters and electric components for hybrids.	Issuance of laws exempting vehicles from customs, and registration fees.	Create institutions to support technical standards for transportation: • Set up a mechanical inspection unit at the port of Beirut in charge of checking up the emissions and safety standards of imported passenger cars and buses before entering the country.	Aware travelers on ecological and economical benefits of transit bus systems and hybrid and fuel efficient vehicles: • Provide information on CO ₂ and fuel savings comparing to passenger cars, through the proper info display tools: mobile applications, dedicated website, media campaigns, etc.	Create Mobility Monitoring Indicators (MMI) framework to support transport studies aiming at the development of sustainable transportation strategies: • Delegate the CAS with additional experimented personnel and authority to provide on yearly basis the complete MMI set. • Enforce cooperation and communication on transport studies between relevant authorities for time, money and efforts savings.
	Implement legislation governing vehicles emissions: Update and implement decree like that of 6603/1995 relating to standards on permissible levels of exhaust fumes and exhaust quality. Enforce/update the vehicle inspection programme requirements.	 Promote R&D culture in transportation in order to adopt knowledge-intensive hightech management approaches for solving complex urban transport problems in GBA: Encourage local industry to develop and manufacture spare parts. Give incentive to R&D institutions which play an essential role in mitigating transport technologies. Encourage universities to create engineering mobility programmes.

ific measures for deploying mass transit bus system in GBA on de
- Specific
Table 43

Institutional and organizational ca- pacity	Develop institutional capacity to enhance bus transit services: - Recruit and train bus drivers on eco-driving attitude and safety principles. - Recruit and train specialized maintenance technicians. - Recruit and train management and control staff in charge of managing and bus operation.	Clarify and centralize responsibil- ity among concerned government agencies in order to tackle the gap in the transport system management function.	
Policy, legal and regulatory	Legislation favor mass transit trans- port means in general and public bus transit in particular: - Set clear regulations specifying the operation maneuvers of private bus operations and taxi owners (such regulations must be preceded by set- ting up a national policy for the global mass transit sector, including the role of each of the private and public operators and the taxi owners).	Enforce the deployment of bus transit systems: - Create/enhance executive and regulatory bodies in charge of en- suring the design, deployment and follow up of the regulatory framework (set above). - Restructure, empower and enhance the role of the traffic management organization (TMO).	
Market development	Stimulate passengers demand to use mass transit buses: - Design of a complete bus network (bus tracks and bus stop locations) covering all boroughs within GBA.	Deploy effective infrastructure measures like an optimized land use planning: - Reserve lanes within GBA for bus operation (reserved lanes are expect- ed to substitute the parking spaces on both sides of the main avenues; therefore, parking spots must be constructed and managed by munici- palities).	Deploy a combination of access, personal travel planning and parking spots to lock the benefits from the aimed operational and infrastructural measures (set above in this Table).
Economic and financial measures	Favorable treatment for mass transit buses rather than conventional pre- owned gasoline vehicles: - Allocate concessionary fares to older people, students and disabled persons. - Use smart card ticketing schemes allowing travelling on all mass transit buses in GBA with one flexible ticket, available on daily, weekly, monthly, or yearly basis (Long term subscriptions bring additional savings to travelers).	Encourage taxi and shared taxi own- ers to work in the bus mass transit system: - Give special incentives to taxi driv- ers to get involved in the bus mass transit system in order to limit the number of illegal taxis (17 000 taxis) and reduce the extensive number of taxis (33 000 taxis).	

Economic and financial measures Market development Deploy effective oper
 Deploy enective operation measures like optimizing the operation manage- ment of the bus mass transit system: Conserve a clear and regular bus operation. Implement a real-time information system, tracking the bus operation and displaying the waiting time (infor- mation to be displayed on screens in bus stations, on mobile smartphones through special applications and on dedicated websites). Deploy personalized travel planning tools in order to optimize and predict the travel time. Implement intelligent transport tech- nologies like the transit signal priority in order to reduce the bus stop times on red lights. Set up stringent maintenance and cleanliness program.
Develop the supply channels of bus mass transit system: - Purchase sufficient number of transit buses with the proper power- train technology, in order to cover the designed network and avoid irregu- larities in operation. - Construct bus stations taking into consideration the physical access to buses and stations (for example: improvements to pavements, access ramps for people with limited acces- sibility, timetables which can be read by those with visual impairment). - Construct relevant maintenance and repair workshop.

L

109

Table 44 - Specific measures to create a market of hybrid and fuel efficient vehicles for implementing a scrappage programme.

Social awareness	Dissemination of information to consumers on these cars' performance, environmental and economical benefits: - Enforce new car dealers to post up factsheets on all vehicles, clearly displaying information on vehicle average fuel consumption and annual fuel costs, in addition to average CO ₂ emissions. - Enforce all marketing campaign (billboards, TV, etc.) to post up the mentioned above consumption and emissions labeling of the car. - Enforce all government vehicles to switch to HEV when buying new cars, in order to take the lead as a reference project.	Dissemination of information to particular consumers which have high annual mileage like taxi drivers and commercial vehicle users: - Present additional financial incentives like the full subsidy of loan interests over the loan period.	
Policy, legal and regulatory	Issuance of law modifying the current tax figure in order to cope with the high demand for high fuel consuming pre-owned vehicles: - Adopt a Bonus-Malus tax policy where polluters pay more annual road-usage fees.		
Market development	Create a car termination plant: - Create a plant that deals with the car termination process after the swap in the scrappage programme (interested customers in swap shall not have a grant salvage value for their old car or any incentive unless they got the certificate of car termination from the MoE or other special entity in charge). (car termination process is one of the success key of the scrappage program; therefore, old car termination options should be clearly stated and formulated).		
Economic and financial measures	 Government incentives to consumer: Exemption from road-usage fee at registration. Payment of minimum salvage value (ex. 2500 USD) as down payment for car loan. Extension of loan period to 8 years particularly for hybrid car purchase. Reduce loan interest and/or full subsidy of loan interests for heavy mileage drivers like taxi owners. 	Government incentives to technicians: - Help domestic maintenance and repair technicians to buy equipments through banking facilities (kafalat programme).	Set up stringent fuel-efficiency and emissions standards on pre-owned imported vehicles: - Fuel-efficiency and emissions standards are intended to help setting adequate tax policies (Bonus- Malus: polluters pay more taxes), in order to favor low consuming new and pre-owned vehicle rather than high consuming pre-owned vehicles.

I

Economic and financial measures Ma Government disincentives to import of non efficient pre-owned vehicles: Set up coherent tax policies disadvantaging the demand for high fuel consuming pre-owned vehicles: - Reduce gradually maximum age of imported pre-owned vehicles: - Reduce gradually maximum age of imported pre-owned vehicles: - Reduce gradually maximum age of imported pre-owned vehicles: - Road-usage fees must be reconsidered according to fuel efficiency and/or emissions rather than engine displacement as the current figure: Increase gradually road-usage fees on old high consuming vehicles, already owned by consumers Increase road-usage and registration fees on imported pre-owned high consuming vehicles	Market development	Policy, legal and regulatory	Social awareness
Reduce road-usage and registration fees on new and pre-owned low consuming vehicles. - Increase road-usage fees on the second owned car, for private use.			

L

5.7 Cost benefit analysis for identified measures in transport sector

Specific transportation costs evaluated

Cost Benefit Analisys is carried out in this study in order to evaluate the economic impacts of the prioritized technologies on the government and the car users. The economic evaluation considered comes under the objective of maximizing the cost reduction of daily passengers' trips. It involves quantifying the cost of market resources like the ownership and operation costs, and non-market resources like the travel time, the crash impact and environmental quality. The specific transportation costs evaluated are summarized in Table 45.

Specific cost Description Cost category⁽¹⁾ Market/Non market Internal-fixed Vehicle ownership Cost for owning a vehicle, including the Market vehicle purchase cost (minus its salvage value by the end of the vehicle life estimated 10 years), insurance fees, custom and excise fees, registration fees, road-usage fees and financing charges. Vehicle operation Internal-variable Market Vehicle operation costs including the cost of consumed fuel, maintenance and tires costs. Travel time The cost of the time used during the travel. Internal-variable Non-market Non-market Congestion The external costs a vehicle imposes on External other travelers. Parking Internal-fixed Market Parking fees borne directly by the car users or the government. Internal crash Damage costs of vehicle accidents borne Internal-variable Non-market directly by travelers. External crash Damage costs a traveler imposes on others External Non-market during vehicle accidents. Air pollution Costs of air pollution emissions from vehicle External Non-market exhaust. **GHG** emissions Cost of reducing GHG emissions or External Non-market removing GHGs from the atmosphere through carbon dioxide sequestration **Operation subsidies** Financial subsidies for implementing the External Market required measures. Fuel tax revenues Revenues to the government from tax on External (from the Market consumed fuel of passenger cars. government perspective) Internal-variable (from car user perspective)

Table 45 - Specific transportation costs assessed in the CBA.

⁽¹⁾ Cost categories are: internal/external, fixed/variable. Internal costs are directly borne by the car user; external costs are borne by others. Variable costs are related to the external variable factors like the fuel consumption or the mileage; fixed costs are not affected by these external variable factors.

Transport modes and travel conditions evaluated

Table 46 summarizes the transport technologies evaluated in this CBA that was prioritized in an early stage of the TNA. The specific cost estimates of Table 45 are computed for each of the considered technologies under three travel conditions (urbanpeak, urban off-peak and rural). These estimates are based on extensive research of the real Lebanese driving conditions in GBA through simulation and on-road measurements (Mansour et al., 2011; Mansour and Zgheib, 2012), in addition to assessing the Lebanese vehicle market (Mansour et al., 2011; MoF, 2011; MoE/UNDP/GEF, 2011; Team, 2010).

Methodology for computing the net benefits

Transportation is undoubtedly one of the most complicated economic sectors. It exhibits a number of specific features that renders a common economic wisdom in considering only the relevant peculiarities in the assessment of the sectors' costs and benefits (refer to Table 45). Transportation costs and benefits tend to have a mirror-image relationship: benefits are considered as a reduction in costs, and costs are considered a reduction in benefits. Accordingly, benefits of the identified measures are computed as a reduction in transport costs of the prioritized technologies comparing to BAU. Two BAU technologies are considered, the transport costs of a typical average Lebanese car and those of a typical non-fuel efficient gasoline car. For example, the mass transit bus system benefits are calculated based on the reduction of its total costs (internal and external) per passengerkilometer compared to the total costs obtained with BAU technologies. As a result, this CBA starts in next section by quantifying the internal and external costs of each of the studied technologies.

Technology ⁽¹⁾	Description
Average gasoline car	Mid-size passenger car emulating the average consumption of the Lebanese car fleet. Purchase cost: USD 30,000. Fuel consumption (urban peak/ urban off-peak/ rural): 15.8/ 11.2/ 9.1 I/100km.
Non fuel efficient gasoline car	Large passenger car or SUV emulating the non fuel efficient vehicles observed in the Lebanese fleet. Purchase cost: USD 50,000. Fuel consumption (urban peak/ urban off-peak/ rural): 23.6/ 16.6/ 13.5 l/100km.
Sub-compact fuel efficient car	Small passenger car from the sub-compact segment. Purchase cost: USD 13,000. Fuel consumption (urban peak/ urban off-peak/ rural): 9.5/ 6.7/ 5.4 I/100km.
Compact fuel efficient car	Mid-size passenger car from the compact segment with fuel efficient powertrain. Purchase cost: USD 25,000. Fuel consumption (urban peak/ urban off-peak/ rural): 11.4/ 8.0/ 6.5 l/100km.
Micro hybrid electric vehicle	Sub-compact hybrid passenger car equipped only with stop/start hybrid functionality. Purchase cost: USD 15,000 ⁽²⁾ . Fuel consumption (urban peak/ urban off-peak/ rural): 6.4/ 5.8/ 4.7 l/100km.
Full hybrid electric vehicle	Compact hybrid passenger car with maximum hybrid functionalities: stop/start, brake energy recovery, electric boost, electric drive mode. Purchase cost: USD 35,000 ⁽²⁾ . Fuel consumption (urban peak/ urban off-peak/ rural): 5.4/ 5.3/ 4.9 l/100km.
Diesel bus	12-meter diesel bus operating on dedicated lanes in GBA. Purchase cost: USD 300,000 (borne by the government). Fuel consumption (urban peak/ urban off-peak/ rural): 33.4/ 33.4/ 27.2 l/100km.

Table 46 - Transport technologies evaluated.

⁽¹⁾ The estimated average annual mileage for all passenger cars is 15 000 km. The vehicle life is considered 10 years for passenger cars and 20 years for buses.

⁽²⁾ Considered purchase cost of hybrid vehicles is exempted from custom/excise fees and registration fees.

Cost Benefit Analysis

This section describes and estimates the specific transport costs presented in Table 45 for the following technologies: (1) mass transit bus technologies, (2) hybrid vehicles and (3) fuel efficient gasoline-powered vehicles. These monetized cost estimates are provided for urban peak, urban off-peak and rural driving conditions in GBA, then average savings are computed on the base that urban peak constitute 51.1% of the total travel time, 31.2% for urban off-peak and 17.7% under rural. This travel distribution is determined from an extensive GPS survey of GBA driving conditions (Mansour and Zgheib, 2012). They represent GBA average costs, except where noted otherwise due to lack of data.

Methodology and estimates of specific transport costs under GBA driving conditions

Vehicle ownership and operating costs

The direct user expenses to own and use transport technologies are computed in this section under the vehicle ownership costs and the vehicle operating costs. These costs permit to determine savings that result from alternative and fuel-efficient transport means with respect to the BAU, considered in this study the average gasoline passenger car. Table 47 and Table 49 summarize the vehicle operating and ownership costs of the considered technologies in USD/veh.km and in USD/pass.km, assuming that the vehicle occupancy in GBA estimated at 1.2 pass/veh for passenger cars and 25 pass/veh for buses, under urban peak driving conditions. Similar exercise for operating costs is applied for GBA offpeak and rural driving conditions, summarized in Table 48.

	Average car	Non fuel- efficient car	Sub- compact fuel efficient car	Compact fuel efficient car	HEV Stop/ Start	HEV Full Hybrid	Diesel bus
Fuel consumption ⁽¹⁾ (USD/veh.km)	0.1900	0.2826	0.1135	0.1362	0.0965	0.0648	0.2896
Maintenance ⁽²⁾ (USD/veh.km)	0.0275	0.0311	0.0262	0.0262	0.0262	0.0112 ⁽³⁾	0.2858(4)
Tires ⁽⁵⁾ (USD/veh. km)	0.0060	0.0124	0.0060	0.0060	0.0060	0.0060	0.0400 ⁽⁶⁾
Operating costs (USD/veh.km)	0.2234	0.3261	0.1457	0.1683	0.1286	0.0819	0.6154
Operating costs ⁽⁷⁾ (USD/pass.km)	0.186	0.272	0.121	0.140	0.107	0.068	0.025

Table 47 - Vehicle operating costs of the studied transport technologies under GBA peak driving conditions.

⁽¹⁾ computed from the vehicle fuel consumption under GBA driving conditions (I/100km) (Annex V, Table 1), the annual mileage (estimated at 15000 km) and the fuel cost (1.2 USD/liter of gasoline and 0.867 USD/liter of diesel).

⁽²⁾ estimated from the American Automobile Association in 2010 as no local data is available (AAA, 2010).

⁽³⁾ estimated from end-of-life accelerated on-road vehicle testing, on 6 full-hybrid electric vehicles (USDOE, 2011).

⁽⁴⁾ estimated from the Environmental and Energy Study Institute (EESI, 2009).

⁽⁵⁾ average tire costs in the Lebanese market are 120 USD/tire for compact passenger cars and 250 USD/tire for large passenger cars and SUV. The total mileage considered before changing tires is 50 000 km.

⁽⁶⁾ estimated from maintenance results over 12-month period on New York city transit buses (Barnitt, 2006).

⁽⁷⁾ vehicle occupancy in GBA is estimated 1.2 pass/veh for passenger cars 25 pass/veh for buses under urban peak driving conditions.

Table 48 - Vehicle operating costs of the studied transport technologies under GBA off-peak and rural driving conditions.

	Average car	Non fuel- efficient car	Sub- compact fuel efficient car	Compact fuel efficient car	HEV Stop/ Start	HEV Full Hybrid	Diesel bus
Operating costs under GBA off-peak ⁽¹⁾ (USD/pass.km)	0.139	0.202	0.093	0.107	0.087	0.067	0.025
Operating costs under rural ⁽²⁾ (USD/pass.km)	0.119	0.171	0.081	0.092	0.080	0.063	0.022

⁽¹⁾ Vehicle occupancy off-peak driving conditions is estimated 1.2 pass/veh for passenger cars and 10 pass/veh for buses. ⁽²⁾ Vehicle occupancy under rural driving conditions is estimated 1.2 pass/veh for passenger cars and 15 pass/veh for buses.

Table 49 - Vehicle ownership costs of the studied transport technologies.

	Average car	Non fuel- efficient car	Sub-compact fuel efficient car	Compact fuel efficient car	HEV Stop/ Start	HEV Full Hybrid
Vehicle purchase ⁽¹⁾ (USD)	30000	50000	13000	25000	15000	35000
Salvage value ⁽²⁾ (USD)	7600	12660	3290	6330	3800	8860
Insurance ⁽³⁾ (USD/year)	510	800	263.5	437.5	292.5	582.5
Custom/Excise ⁽⁴⁾ (USD)	10666.7	20666.7	2283.3	8166.7	3166.7	13166.7
Registration ⁽⁵⁾ (USD)	1200	2000	520	1000	600	1400
Registration (USD)	1200	2000	520	1000	600	1400
Road-usage fees ⁽⁶⁾ (USD)	810	2286.7	810	810	810	810
Financing charges ⁽⁷⁾ (USD/year)	597.5	995.8	258.9	497.9	298.7	697.1
Ownership costs (USD/year)	3549	5959	1626	2983	1852	4114
Ownership costs (USD/veh.km)	0.2366	0.3972	0.1084	0.1989	0.1235	0.2743
Ownership costs (USD/pass.km)	0.1972	0.3310	0.0903	0.1657	0.1029	0.2286

⁽¹⁾ Estimated from Lebanese market survey and personal communication with BUMC (Toyota dealer) (Bejjani, 2012)

⁽²⁾ Vehicle depreciation is estimated 20% for the first year and 12% for the following years. Vehicle life is estimated 10 years. ⁽³⁾ Insurance fees are computed according to the following formula: 14.5% of the vehicle purchase cost during the loan period (5 years), in addition to 150 USD/year after loan period for the last 5 years. The total insurance sum is divided over the 10 years of the vehicle life.

⁽⁴⁾ Refer to (MoF, 2011) for details of the custom and excise fees.

⁽⁵⁾ Car registration fees are 4% of the vehicle's estimated value, considered in this study similar to the vehicle purchase cost (MoF, 2011). ⁽⁶⁾ Road-usage fees are locally known by "road-usage fees". New cars are exempted from this fee for the first 3 years (Informs, 2012). Refer to (MoF, 2011) for details on the road-usage fees. All vehicles are considered in the 11-20 horsepower category, except the non fuel efficient car 31-40 horsepower. The estimated values are computed over the vehicle life (10 years). ⁽⁷⁾ Financing charges are the bank loan interest over the 5 years car loan.

Therefore, the total vehicle costs (which stand for the ownership and the operation costs) per vehiclekilometers and per passenger-kilometers are illustrated in Fig. 36. Note that these costs are borne by the user and not the government. Moreover, the subsidy measures intended for hybrid and fuel efficient car buyers has not been included in this section (refer to section operation subsidies by Lebanese government).

Travel time

The cost of travel time refers to the cost of time spent on transport, including waiting as well as actual travel. It is the product of time spent traveling (measured in hr/veh.km) multiplied by unit costs (measured in USD/hr). The traveling time is estimated from the vehicle average speed (Annex V, Table 2), and the unit cost is estimated at 5 USD/hr, for an average wage rate of 800 USD/month (CAS, 2011).

Travel time costs vary significantly, depending on various factors. For example, time spent in discomfort has higher unit costs than time spent in comfortable conditions. Hence, for this evaluation, travel is divided into four categories, with different cost values, as summarized in the Table 50 (Litman, 2011a).

Travel time cost results are summarized in Table 51, under urban peak driving conditions. Two different scenarios are considered for the bus transit system: (1) bus transit operating on dedicated lanes in GBA and (2) bus transit not operating on dedicated lanes. Results for off-peak and rural driving conditions are summarized in Table 52.

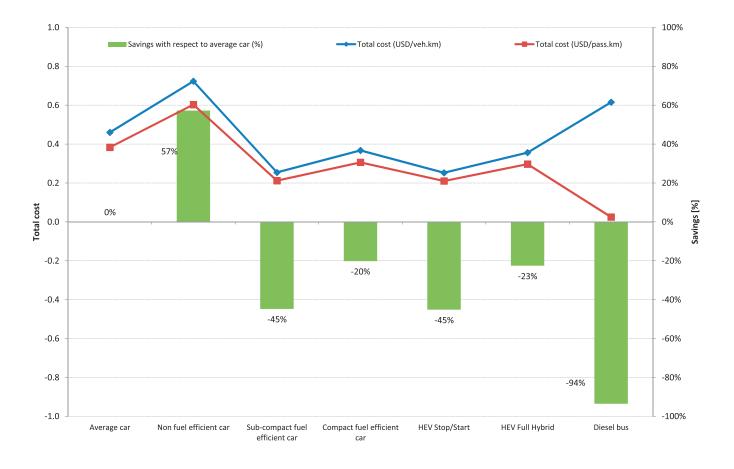

Fig. 36 - Total vehicle costs of the studied transport technologies under GBA peak driving conditions.

Category	Description	Cost value	Portion of travel time
Paid	Travel by employees when being paid, including business people traveling to meetings, and workers traveling between job sites.	150% wage rates	5% commercial travel
Personal, high cost	Personal travel during which travelers experience significant discomfort or frustration, such as driving in congestion or pedestrians and transit passengers in uncomfortable conditions.	50% wage rates for drivers, 35% of wages for passengers	20% Typical for urban-peak commute that occurs under congested or unpleasant conditions
Personal, medium cost	Personal travel during which travelers experience no discomfort.	25% wage rates for adults	50% Typical of errand trips under uncongested conditions
Zero-cost travel time	Travel that users enjoy and so would pay nothing to reduce their travel time.	No cost	25% Typical for recreational travel and some personal travel

Table 50 - Travel time cost categories used in the CBA.

Table 51 - Travel time cost under GBA peak driving conditions in US¢/pass.km.

	Passenger cars	Bus system not operating on reserved lanes	Bus system operating on reserved lanes
Paid	2.1	2.6	1.9
Personal, high cost	2.8	3.4	2.5
Personal, medium cost	3.6	4.3	3.1
Zero-cost travel time	0	0	0
Travel time cost (US¢/pass.km)	8.5	10.2	7.5

Table 52 - Travel time cost under GBA off-peak and rural driving conditions in US¢/pass.km.

	Passenger cars	Bus system not operating on reserved lanes	Bus system operating on reserved lanes
Travel time cost under GBA peak driving conditions (US¢/pass.km)	3.8	4.6	4.3
Travel time cost under rural driving conditions (US¢/pass.km)	2.9	3.5	2.9

Congestion

Congestion costs consist of both internal and external costs that result from the interference among vehicles during traffic, particularly as traffic volumes approach the maximum road's capacity. These costs are the incremental delay during traffic, the additional fuel consumption, the vehicle components wear, the pollution emissions and the cost of the passengers' discomfort (Hau, 1992). To prevent double counting, internal congestion costs that are borne by the drivers are not considered in this section since they have been accounted for under the travel time cost, the emissions cost, the crash cost and the vehicle operating cost. Therefore, Table 53 presents the external congestion costs a vehicle imposes on other travelers.

Crash costs

The crash costs assessed in this study is the monetized value of damages caused by vehicle accidents. They include the damages to the individual traveling by a particular vehicle (internal costs), and the damages imposed by an individual on other travelers (external costs).

Due to lack of data availability on crash costs in Lebanon, data are borrowed from the literature. The internal crash costs are estimated at 5.2, 5.8 and 0.25 US¢/pass.km for average car, compact car and diesel bus respectively; and the external crash cost at 3.4, 3.3 and 16.5 US¢/veh.km respectively (Litman, 2011c).

• Air pollution

Air pollution costs refer to motor vehicle air pollutant damages, including human health, ecological and esthetic degradation. The scope of pollutant emissions analysis in this study is narrowed to considering only emissions from vehicle exhaust pipes. Therefore, air pollution cost estimates are based on reflecting only exhaust emissions during vehicle operation (CO, NO_x , PM, VOC, SO_2). It excludes upstream emissions that occur during fuel production and distribution, and the pollution associated with vehicle manufacturing, as these costs are not borne by the Lebanese government.

Literature provides extremely divergent estimates of air pollution costs (Delucchi, 2004; Litman, 2002; Holland et al., 2002; Wang et al., 1995). Average estimates are considered in this analysis, and air pollution estimates are summarized in Table 54, in US¢/pass.km (Litman, 2011d).

• GHG emissions

The greenhouse gas emission values are based on the mitigation cost estimates, which is the cost of reducing GHG emissions from the atmosphere through carbon dioxide sequestration, and therefore reducing future climate change damages. Several studies suggest that GHG mitigation costs will remain 20-50 USD/tonne of CO_2 equivalent for some time, although this may increase to achieve larger emission reductions (Litman, 2012). A value of 35 USD/tonne is used in this analysis as the default value.

To calculate the per kilometer cost of GHG emissions, the Tank-to-Wheel GHG emissions from the analyzed transportation technologies (in g/km) are multiplied by the considered GHG mitigation cost. Results are summarized in Table 55.

Operation subsidies by Lebanese government

Reviewing the identified measures to deploy hybrid and fuel-efficient gasoline vehicles, market and consumer incentives are inevitable. The incentives mainly intend to reduce the vehicle purchase and ownership costs, through:

- exemption from customs and excise fees on vehicle and spare parts to favor suppliers invest
- exemption from registration fees and from road-usage fee at registration
- payment of minimum salvage value as down payment for the car loan
- banking facilities through loan extension up to 8 years
- reduce loan interest and/or full subsidy of loan interests over loan period

Table 56 summarizes the government subsidy assuming an average annual mileage of 15,000 km per vehicle and an average occupancy of 1.2 passengers per vehicle.

• Fuel excise

The government collects indirect revenues from car usage through a tax levied on imported liters of gasoline. Excise on gasoline is not an added value tax, it a specific tax levied as function of volume. It is estimated around 400 LBP/liter of gasoline (0.267 USD/liter). Table 57 highlights the gasoline excise revenues of the government on the evaluated transport technologies.

Table 53 - Congestion costs considered in the analysis in US¢/pass.km.

	Passenger car	Diesel bus operating on dedicated lanes	Diesel bus not operating on dedicated lanes

Subsidy of loan interest ⁽⁵⁾	0	0	0	0
Total subsidy	1.27	4.53	2.09	8.09

⁽¹⁾ Refer to (MoF, 2011) for details of the custom and excise fees. The vehicle costs are estimated at USD 13,000, 25,000, 15,000 and 35,000 for the sub-compact, compact, stop/start and full hybrid vehicles respectively.

⁽²⁾ Car registration fees are 4% of the vehicle's estimated value, considered in this study similar to the vehicle purchase cost (MoF, 2011).

⁽³⁾ Road-usage fees are locally known by "road-usage fees". New cars are exempted from this fee for the first 3 years (Informs, 2012). ⁽⁴⁾ This value is the difference between the salvage value of the swapped old car, borne by the government, and the return on salvage value. An efficient car termination programme of swapped cars should bring this value to zero.

⁽⁵⁾ The government full subsidy of loan interest over loan period is not considered in this analysis. Taxi drivers, students and disabled persons are only eligible for this incentive.

	Average gasoline car	Non fuel efficient gasoline car	Sub-compact fuel efficient car	Compact fuel efficient car	Stop/start hybrid electric vehicle	Full hybrid electric vehicle
Urban peak	4.2	6.3	2.5	3.0	1.7	1.4
Urban off-peak	3.0	4.4	1.8	2.1	1.7	1.4
Rural	2.4	3.6	1.5	1.7	1.3	1.3

Cost benefit analysis results

The objective of the CBA is to identify the cost value of the prioritized measures and technologies in order to support setting a beneficial transport policy, favoring lower-cost transport technologies over higher-cost transport technologies. Thus, it is of great interest to presents the costs and benefits results from two perspectives: the passenger car users' perspective and the government's perspective. Costs and benefits from the passenger car users' perspective

Considerable savings are observed, particularly when car users swap from non efficient cars to buses or fuel efficient cars (Fig. 37 and Fig. 38). Such swap becomes feasible if the car purchase loan is spread to over an 8-year loan period, as illustrated in the net cash flow of car users (Fig. 40 and Fig. 41). The net cash flow calculation is based on both revenues and mandatory charges. Therefore, the benefits depend on the income activity of the car user (Fig. 39).

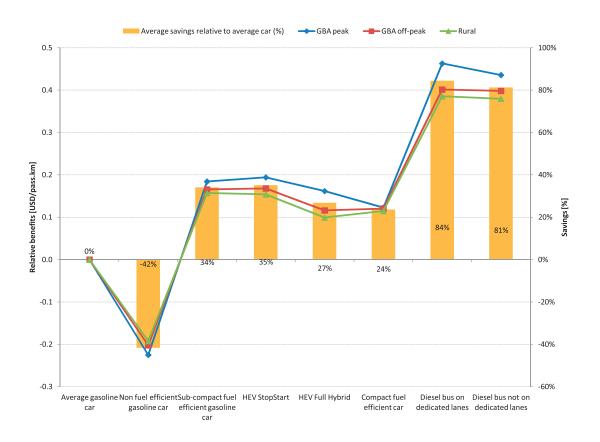

Fig. 37 - Car users benefits of transport technologies relative to average car under GBA driving conditions.

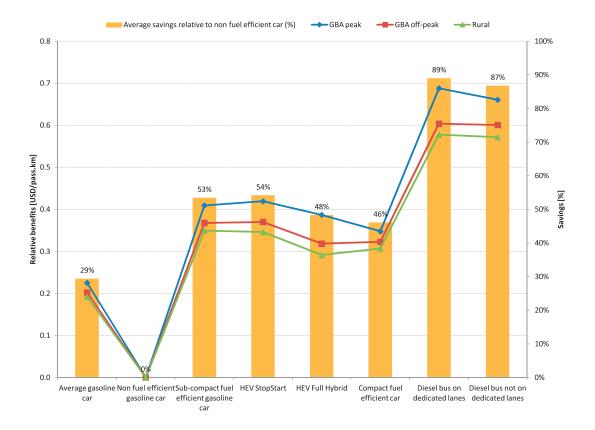

Fig. 38 - Car users benefits of transport technologies relative to non fuel efficient car under GBA driving conditions.

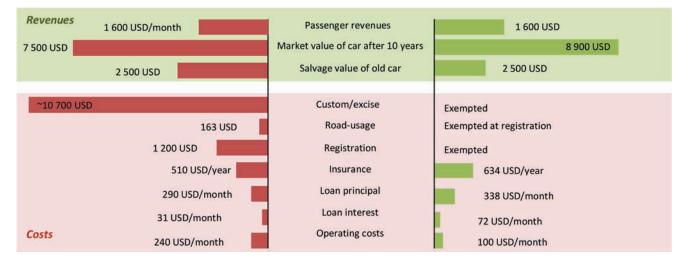

Fig. 39 - Revenues and costs of an average car versus a full hybrid car.

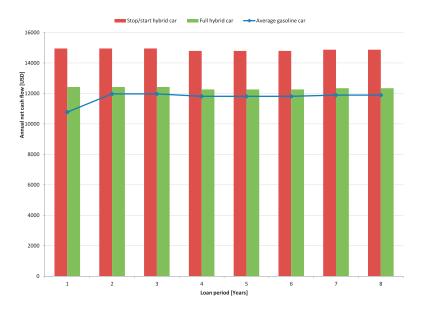

Fig. 40 - Annual net cash flow for a stop/start and full hybrid car user over an 8-year loan period.

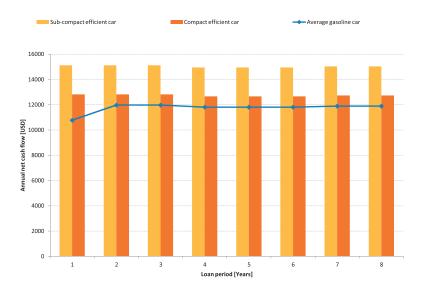

Fig. 41 - Annual net cash flow for a sub-compact and compact fuel efficient car user over an 8-year loan period.

At this stage, it is interesting to identify the specific key parameters that maximize the car users' benefits. For passenger cars, full hybrid cars serve as a good example. It costs nearly 0.4 USD/ pass.km: 27% and 48% more beneficial than the average and the non fuel efficient cars respectively. The largest benefit examined come from the vehicle operation cost reduction due to the higher efficiency of the hybrid powertrain, as illustrated in Fig. 42 and Fig. 43. As a result, including energy efficiency as decision-making criteria for buying a car is a key parameter for achieving considerable benefits. Thus, energy efficiency indicators must imperatively be communicated to car buyers, through appropriate standards and regulations imposed by the government.

Similar analysis shows that the diesel bus operating on dedicated lanes in GBA brings additional benefits to travelers, 84% and 89% more beneficial than the average and the non fuel efficient cars respectively. Benefits come mainly from reducing the vehicle ownership cost, the vehicle operation cost in addition to reducing the crash and parking costs, and no operation subsidy has to be borne by the government, as illustrated in Fig. 43.

Therefore, maximizing the transport benefits from the car users' perspective implies selectively eliminating the worst energy efficient vehicle technologies in the fleet and stimulating replacement by the best performing vehicles (including mass transit buses) with the highest energy efficiency per passenger-kilometer.

 Costs and benefits from the government's perspective

Several scrappage and fleet renewal schemes have been implemented worldwide in order to improve air quality, reduce dependence on imported fuels, reduce CO₂ emissions and support the automotive industry (ECMT, 1999; ITF, 2011). Among the well designed fleet renewal schemes: the United States CARS programme, the German Umweltprämie and in France the Prime à la Casse programme in 2009. All the 3 programmes did not succeed in recovering the total government costs. Only 80% of the US government costs were recovered through societal benefits like fuel savings, pollutant and $\mathrm{CO}_{\!_2}$ emissions savings, traffic casualties and serious injuries avoided. The German and French programmes were even poorer with 25% and 46% of cost recovery respectively (ITF, 2011). Therefore, objectives of scrappage and fleet renewal programmes are not designed to bring benefits to the government rather than for economic stimulus and environmental and health protection. Fleet renewal programmes are designed for their economic stimulus, environmental and health protection rather than cash benefits to the government.

Similar figures are observed in this CBA exercise from the Lebanese government perspective. Scrappage scheme by swapping average cars with hybrid and fuel efficient cars would allow the government to recover between 44% and 90% of the government costs (Fig. 44). Only bus systems would bring benefits. However, it is worth mentioning that the current trend of massive market submerge with non fuel efficient cars also do not allow cost recovery for the government: 33% of losses are observed comparing to an average car. Therefore, a well designed scrappage programme would be beneficial if mainly targeting on eliminating non fuel efficient cars, as illustrated in Fig. 45.

Note that, observed results derive from the current figures of tax levied on fuel imports in Lebanon, from road-usage fees, from custom duties excise tax, and VAT from cars at import. However, a well designed and effective scrappage programme should be implemented in parallel with a tax reform, at least at the road-usage fees, where highpolluters should be penalized and low-polluters recompensated. With such reform, the government will be able to optimize more efficiently its revenues from the scrappage programme. Upper purchase cost limit of the hybrid electric and fuel efficient cars

Since not all hybrid and fuel efficient cars allow total recovery of the government costs, as illustrated in Fig. 45, there is an upper purchase cost limit of these cars for having 100% recovery. The maximum purchase cost is estimated at USD 23,000, as illustrated in Fig. 46. Therefore, all fuel efficient and hybrid electric vehicles with lower purchase cost should be subsidized without any loss to be borne by the government.

Table 58 summarizes the government foregone revenues and the car users' benefits over the vehicle life (estimated 10 years), under the scrappage programme. The societal and economical benefits to car users' are 2.5 to 5 times the foregone revenues borne by the government during the programme. Therefore, such programme implies an important economical stimulus to car users.

• Peak shift savings

An additional interesting issue to consider in the CBA is improving the level of service of GBA roads, and therefore, switching from urban peak to offpeak driving. From both the government and the car users' perspectives, maximizing benefits is obtained from shifting transport demand to bus mass transit operating on dedicated lanes, as illustrated in Fig. 47 and Fig. 48. As a consequence, the new thinking approach in establishing a sustainable transport policy in GBA is (1) to shift transport demand massively to mass transit systems, (2) to swap non efficient technologies with efficient technologies through well designed scrappage scheme, and (3) to switch from peak to off-peak driving conditions by avoiding unnecessary trips and shifting demand to mass transit.

The CBA has considered the different technologies under the mitigation strategies proposed in the TNA. Internal and external costs have been computed from both perspectives: passenger car users and the government, under the current Lebanese driving conditions.

Considerable savings are observed from car users' perspective in both cases: swapping to fuel efficient vehicles or shifting to bus transit system. The benefits examined come from reducing the vehicle operation cost reduction due to the higher efficiency of the buses and the hybrid car technologies investigated.

I

Fig. 46 - Upper purchase cost limit of hybrid and fuel efficient cars.

Table 58 - Government foregone revenues and car users' benefits over 10 years for the upper purchase cost limit of hybrid and compact fuel efficient cars.

	Hybrid electric vehicle at USD 23,000	Compact fuel efficient car at USD 23,000
Government foregone revenues relative to average car ⁽¹⁾	Car tax exemption at purchase: USD 8,000 Foregone gasoline excise fees due to fuel savings: USD 4,175 Total: USD 12,175	Car tax exemption at purchase: USD 7,100 Foregone gasoline excise fees due to fuel savings: USD 1,800 Total: USD 8,900
Car users' benefits	USD 31,770 /veh	USD 22,140 /veh
relative to average car ⁽²⁾		000 22,140 / VCH
Government foregone revenues relative to non fuel efficient car ⁽¹⁾	Car tax exemption at purchase: USD 8,000 Foregone gasoline excise fees due to fuel savings: USD 7,275 Total: USD 15,275	Car tax exemption at purchase: USD 7,100 Foregone gasoline excise fees due to fuel savings: USD 4,900 Total: USD 12,000
Car users' benefits relative to non fuel efficient cars ⁽²⁾	USD 70,000 /veh	USD 60,350 /veh

⁽¹⁾ The government forgone revenues are the operation subsidies in addition to the forgone gasoline excise fees due to fuel savings. ⁽²⁾ The car users' benefits considered include car ownership savings, operating cost savings, travel time reduction, parking and crash savings and the operation subsidies received from the government.

- Peak shift savings of transport technologies relative to average car (%)
- Peak shift savings of transport technologies relative to non efficient car (%)

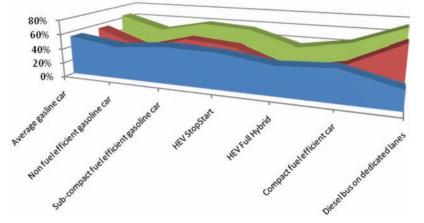

Fig. 48 - Peak shift savings from the government perspective.

Similar benefit figures are observed in this CBA exercise from the Lebanese government perspective, particularly adopting bus transit system on dedicated lanes in GBA. Scrappage scheme as defined in this CBA would allow the government to partially recover its investment costs. However, the current trend of massive market submergence with non fuel efficient cars also implies considerable cost (losses) on the government.

As a result, according to this CBA, the development of transport sector within the transition to a sustainable mobility and a green economy would be well served for both the Lebanese government and the car users by the adoption of the following specific actions:

Shifting travel demand in GBA to the most

efficient mode: bus transit on dedicated lanes, as benefits are considerable for both the car users and the government.

- Eliminating the least energy efficient vehicle technologies in the fleet and stimulating replacement by the best performing vehicles, through implementing a well designed scrappage programme.
- Adopting in parallel to the scrappage programme a tax reform scheme, at least at the road-usage fees, where high-polluters are penalized and low-polluters recompensed. With such reform, the government will be able to optimize more efficiently its revenues from the scrappage programme.
